Package ‘sp’

February 20, 2015

Version 1.0-17

Date 2014-11-16

Title classes and methods for spatial data

Depends R (>= 2.14.0)

Imports methods, graphics, utils, lattice, grid

Suggests RColorBrewer, rgdal (>= 0.8-7), rgeos (>= 0.2-20), gstat

Description A package that provides classes and methods for spatial data. The classes document where the spatial location information resides, for 2D or 3D data. Utility functions are provided, e.g. for plotting data as maps, spatial selection, as well as methods for retrieving coordinates, for subsetting, print, summary, etc.

addAttrToGeom-methods

constructs SpatialXxxDataFrame from geometry and attributes

Description

constructs SpatialXxxDataFrame from geometry and attributes

Usage

addAttrToGeom(x, y, match.ID, ...)

Arguments

x  
geometry (locations) of the queries

y  
data.frame object with attributes

match.ID  
logical; if TRUE, the IDs of the geometry and of the data.frame are matched (possibly swapping records), and an error occurs when some IDs do not match

...  
(optional) arguments passed to the constructor functions

Value

an object of class XxxDataFrame, where Xxx is the class of x

Methods

x = "SpatialPoints", y = "data.frame"

x = "SpatialPixels", y = "data.frame"

x = "SpatialGrid", y = "data.frame"

x = "SpatialLines", y = "data.frame"

x = "SpatialPolygons", y = "data.frame"

Author(s)

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>

See Also

overlay, point.in.polygon
aggregate                 aggregation of spatial objects

Description

spatial aggregation of thematic information in spatial objects

Usage

## S3 method for class 'Spatial'
aggregate(x, by, FUN = mean, ..., dissolve = TRUE)

Arguments

x          object deriving from Spatial, with attributes
by         aggregation predicate; if by is a Spatial object, the geometry over which attributes in x are aggregated; if by is a list, aggregation by attribute(s), see aggregate.data.frame
FUN        aggregation function
...        arguments passed on to function FUN
dissolve   logical; should, when aggregating based on attributes, the resulting geometries be dissolved? Note that if x has class SpatialPointsDataFrame, this is not possible

Value

Function aggregate.Spatial aggregates the attribute values of x either over the geometry of by by using over for spatial matching, or by attribute values, using aggregation function FUN.

Note

uses over to find spatial match if by is a Spatial object

Author(s)

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>

Examples

data("meuse")
coordinates(meuse) <- ~x+y
data("meuse.grid")
coordinates(meuse.grid) <- ~x+y
gridded(meuse.grid) <- TRUE
i = cut(meuse.grid$dist, c(0,.25,.5,.75,1), include.lowest = TRUE)
j = sample(1:2, 3103,replace=TRUE)
## Not run:
if (require(rgeos)) {
  # aggregation by spatial object:
  ab = gUnaryUnion(as(meuse.grid, "SpatialPolygons"), meuse.grid$part.a)
  x = aggregate(meuse["zinc"], ab, mean)
  spplot(x)
  # aggregation by attribute, then dissolve to polygon:
  x = aggregate(meuse.grid["dist"], list(i=i))
  spplot(x["i"])
  x = aggregate(meuse.grid["dist"], list(i=i, j=j))
  spplot(x["dist"], col.regions=bpy.colors())
  spplot(x["i"], col.regions=bpy.colors(4))
  spplot(x["j"], col.regions=bpy.colors())
}
## End(Not run)

x = aggregate(meuse.grid["dist"], list(i=i, j=j), dissolve = FALSE)
spplot(x["j"], col.regions=bpy.colors())

if (require(gstat) && require(rgeos)) {
  x = idw(log(zinc)-1, meuse, meuse.grid, debug.level=0)[1]
  spplot(x[1], col.regions=bpy.colors())
  i = cut(x$var1.pred, seq(4, 7.5, by=.5),
          include.lowest = TRUE)
  xa = aggregate(x["var1.pred"], list(i=i))
  spplot(xa[1], col.regions=bpy.colors(8))
}

---

**as.SpatialPolygons.GridTopology**

*Make SpatialPolygons object from GridTopology object*

**Description**

Converts grids of regular rectangles into a SpatialPolygons object, which can be transformed to a different projection or datum with spTransform in package rgdal. The function is not suitable for high-resolution grids. The ordering of the grid cells is as in coordinates() of the same object, and is reported by IDvaluesGridTopology.

**Usage**

```r
as.SpatialPolygons.GridTopology(grd, proj4string = CRS(as.character(NA)))
IDValuesGridTopology(obj)
as.SpatialPolygons.SpatialPixels(obj)
IDValuesSpatialPixels(obj)
HexPoints2SpatialPolygons(hex, dx)
```
as.SpatialPolygons.GridTopology

Arguments

grd  GridTopology object
proj4string  object of class CRS-class
obj  SpatialPixels object
hex  SpatialPoints object with points that are generated by hexagonal sampling; see spsample
dx  spacing of two horizontally adjacent points; if missing, this will be computed from the points

Value

as.SpatialPolygons.GridTopology and as.SpatialPolygons.SpatialPixels return a SpatialPolygons object; IDvaluesGridTopology and IDvaluesSpatialPixels return a character vector with the object grid indices.

See Also

GridTopology, SpatialPixels, SpatialPolygons spTransform in package rgdal

Examples

library(lattice)  
grd <- GridTopology(cellcentre.offset=c(-175,55), cellsize=c(10,10), cells.dim=c(4,4))  
SpP_grd <- as.SpatialPolygons.GridTopology(grd)  
plot(SpP_grd)  
text(coordinates(SpP_grd), sapply(slot(SpP_grd, "polygons"), function(i) slot(i, "ID")), cex=0.5)  
trdata <- data.frame(A=rep(c(1,2,3,4),4), B=rep(c(1,2,3,4), each=4), row.names=sapply(slot(SpP_grd, "polygons"), function(i) slot(i, "ID")))  
SpPDF <- SpatialPolygonsDataFrame(SpP_grd, trdata)  
nspplot(SpPDF)

data(meuse.grid)  
gridded(meuse.grid)="x+y  
xx = spsample(meuse.grid, type="hexagonal", cellsize=200)  
xxpl = HexPoints2SpatialPolygons(xx)  
image(meuse.grid["dist"])  
plot(xxpl, add = TRUE)  
points(xx, cex = .5)  
## Not run:

df = as.data.frame(meuse.grid[xx,])  
x = SpatialPolygonsDataFrame(xxpl, df, match.ID = FALSE)  
spplot(x, "dist")  
spplot(aggregate(meuse.grid[,1:3], xxpl), main = "aggregated meuse.grid")

## End(Not run)
as.SpatialPolygons.PolygonsList

Making SpatialPolygons objects

Description
This function is used in making SpatialPolygons objects from other formats.

Usage
as.SpatialPolygons.PolygonsList(Srl, proj4string=CRS(as.character(NA)))

Arguments
Srl            A list of Polygons objects
proj4string    Object of class "CRS"; holding a valid proj4 string

Value
The functions return a SpatialPolygons object

Author(s)
Roger Bivand

Examples
bbox-methods

bbox-methods retrieve bbox from spatial data

Description

retrieves spatial bounding box from spatial data

Usage

bbox(obj)

Arguments

obj

object deriving from class "Spatial", or one of classes: "Line", "Lines", "Polygon" or "Polygons", or ANY, which requires obj to be an array with at least two columns

Value

two-column matrix; the first column has the minimum, the second the maximum values; rows represent the spatial dimensions

Methods

obj = "Spatial" object deriving from class "Spatial"

obj = "ANY" an array with at least two columns

obj = "Line" object deriving from class "Line"

grd <- GridTopology(c(1,1), c(1,1), c(10,10))
polys <- as.SpatialPolygons.GridTopology(grd)
plot(polys)
text(coordinates(polys), labels=sapply(slot(polys, "polygons"), function(i) slot(i, "ID")), cex=0.6)
bpy.colors

obj = "Lines"  object deriving from class "Lines"
obj = "Polygon"  object deriving from class "Polygon"
obj = "Polygons"  object deriving from class "Polygons"

Examples

# just 9 points on a grid:
x <- c(1,1,1,2,2,2,3,3,3)
y <- c(1,2,3,1,2,3,1,2,3)
xy <- cbind(x,y)
S <- SpatialPoints(xy)
bbox(S)

# data.frame
data(meuse.grid)
coordinates(meuse.grid) <- ~x+y
gridded(meuse.grid) <- TRUE
bbox(meuse.grid)

bpy.colors  

blue-pink-yellow color scheme, which also prints well on black/white printers

Description

Create a vector of ‘n’ “contiguous” colors.

Usage

bpy.colors(n = 100, cutoff.tails = 0.1, alpha = 1.0)

Arguments

n  number of colors (>= 1) to be in the palette
cutoff.tails  tail fraction to be cut off on each side. If 0, this palette runs from black to white; by cutting off the tails, it runs from blue to yellow, which looks nicer.
alpha  numeric; alpha transparency, 0 is fully transparent, 1 is opaque.

Value

A character vector, ‘cv’, of color names. This can be used either to create a user-defined color palette for subsequent graphics by ‘palette(cv)’, a ‘col=’ specification in graphics functions or in ‘par’.

Note

This color map prints well on black-and-white printers.
bubble

Author(s)
unknown; the palatte was posted to gnuplot-info a few decades ago; R implementation Edzer
Pebesma,<edzer.pebesma@uni-muenster.de>

See Also
rainbow, cm.colors

Examples
bpy.colors(10)
p <- expand.grid(x=1:30,y=1:30)
p$z <- p$x + p$y
coordinates(p) <- c("x", "y")
gridded(p) <- TRUE
image(p, col = bpy.colors(100), asp = 1)
# require(lattice)
# trellis.par.set("regions", list(col=bpy.colors())) # make this default pallette

bubble Create a bubble plot of spatial data

description
Create a bubble plot of spatial data, with options for bicolour residual plots (xyplot wrapper)

Usage
bubble(obj, zcol = 1, ..., fill = TRUE, maxsize = 3, do.sqrt = TRUE, pch,
col = c("#D01C8b","#4dace6"), key.entries = quantile(data[,zcol]), main,
identify = FALSE, labels = row.names(data.frame(obj)), key.space = "right",
scales = list(draw = FALSE), xlab = NULL, ylab = NULL, panel = panel.bubble,
sp.layout = NULL)

Arguments
obj object of, or extending, class SpatialPointsDataFrame or SpatialGridDataFrame, see coordinates or SpatialPointsDataFrame; the object knows about its spatial coordinates
zcol z-variable column name, or column number after removing spatial coordinates from x@data: 1 refers to the first non-coordinate column
fill logical; if TRUE, filled circles are plotted (pch = 16), else open circles (pch = 1); the pch argument overrides this
maxsize cex value for largest circle
do.sqrt logical; if TRUE the plotting symbol area (sqrt(diameter)) is proportional to the value of the z-variable; if FALSE, the symbol size (diameter) is proportional to the z-variable
bubble

**pch** plotting character

**col** colours to be used; numeric vector of size two: first value is for negative values, second for positive values. Default colors: 5-class PiYG from colorbrewer.org.

**key.entries** the values that will be plotted in the key; by default the five quantiles min, q.25, median q.75, max

**main** main plotting title

**identify** logical; if true, regular plot is called instead of xyplot, and followed by a call to identify().

**labels** labels argument passed to plot if identify is TRUE

**...** arguments, passed to xyplot, or plot if identification is required.

**key.space** location of the key

**scales** scales argument as passed to xyplot

**xlab** x-axis label

**ylab** y-axis label

**panel** panel function used

**sp.layout** possible layout items; see `spplot`

**Value**

returns (or plots) the bubble plot; if identify is TRUE, returns the indexes (row numbers) of identified points.

**Author(s)**

Edzer Pebesma

**See Also**

xyplot, mapasp, identify

**Examples**

data(meuse)
coordinates(meuse) <- c("x", "y") # promote to SpatialPointsDataFrame
bubble(meuse, "cadmium", maxsize = 2.5, main = "cadmium concentrations (ppm)",
key.entries = 2^(-1:4))
bubble(meuse, "zinc", main = "zinc concentrations (ppm)",
key.entries = 100 * 2^(0:4))
char2dms

Convert character vector to DMS-class object

Description

These two helper functions convert character vectors and decimal degree vectors to the DMS-class representation of degrees, minutes, and decimal seconds. "DMS" objects cannot contain NAs.

Usage

char2dms(from, chd = "d", chm = "'", chs = "\"")

dd2dms(dd, NS = FALSE)

Arguments

from character vector of degree, minute, decimal second data
chd degree character terminator
chm minute character terminator
chs second character terminator
dd numeric vector of decimal degrees
NS logical, TRUE for north/south decimal degrees, FALSE for east/west decimal degrees

Details

In char2dms, the input data vector should use a regular format, such as that used in the PROJ.4 library, with a trailing capital (NSWE) indicating compass direction.

Value

Both functions return a "DMS" object.

Methods

from = "DMS", to = "numeric" coerce a "DMS" object to a "numeric" vector
from = "DMS", to = "character" coerce a "DMS" object to a "character" vector (the as.character.DMS S3 method is also available)

Author(s)

Roger Bivand <Roger.Bivand@nhh.no>

See Also

DMS-class
Examples

c data(state)
str(state.center$y)
stateN <- dd2dms(state.center$y, NS=TRUE)
str(attributes(stateN))
ch.stateN <- as.character(stateN)
str(ch.stateN)
stateNa <- char2dms(ch.stateN)
str(attributes(stateNa))
ch.stateN <- as(stateN, "character")
str(ch.stateN)
stateNa <- char2dms(ch.stateN)
str(attributes(stateNa))

compassRose

Display a compass rose.

Description

Displays a basic compass rose, usually to orient a map.

Usage

compassRose(x,y,rot=0,cex=1)

Arguments

x, y The position of the center of the compass rose in user units.
rot Rotation for the compass rose in degrees. See Details.
cex The character expansion to use in the display.

Details

‘compassRose’ displays a conventional compass rose at the position requested. The size of the compass rose is determined by the character expansion, as the central "rose" is calculated relative to the character size. Rotation is in degrees counterclockwise.

Value

nil

Author(s)

Jim Lemon
coordinates

set spatial coordinates to create a Spatial object, or retrieve spatial coordinates from a Spatial object

Description

set spatial coordinates to create a Spatial object, or retrieve spatial coordinates from a Spatial object

Usage

coordinates(obj, ...)
coordinates(object) <- value

Arguments

obj object deriving from class "Spatial"
object object of class "data.frame"
value spatial coordinates; either a matrix, list, or data frame with numeric data, or column names, column number or a reference: a formula (in the form of e.g. ~x+y), column numbers (e.g. c(1, 2)) or column names (e.g. c("x", "y")) specifying which columns in object are the spatial coordinates. If the coordinates are part of object, giving the reference does not duplicate them, giving their value does duplicate them in the resulting structure.

... additional arguments that may be used by particular methods

Value

usually an object of class SpatialPointsDataFrame; if the coordinates set cover the full set of variables in object, an object of class SpatialPoints is returned

Examples

# data.frame
data(meuse.grid)
coordinates(meuse.grid) <- ~x+y
gridded(meuse.grid) <- TRUE
class(meuse.grid)
bbox(meuse.grid)

data(meuse)
meuse.xy = meuse[c("x", "y")]
coordinates(meuse.xy) <- ~x+y
class(meuse.xy)
coordinates-methods

retrieve (or set) spatial coordinates

Description

retrieve (or set) spatial coordinates from (for) spatial data

Methods

**obj = "list"**  list with (at least) two numeric components of equal length

**obj = "data.frame"**  data.frame with at least two numeric components

**obj = "matrix"**  numeric matrix with at least two columns

**obj = "SpatialPoints"**  object of, or deriving from, SpatialPoints

**obj = "SpatialPointsDataFrame"**  object of, or deriving from, SpatialPointsDataFrame

**obj = "SpatialPolygons"**  object of, or deriving from, SpatialPolygons

**obj = "SpatialPolygonsDataFrame"**  object of, or deriving from, SpatialPolygonsDataFrame

**obj = "Line"**  object of class Line; returned value is matrix

**obj = "Lines"**  object of class Lines; returned value is list of matrices

**obj = "SpatialLines"**  object of, or deriving from, SpatialLines; returned value is list of lists of matrices

**obj = "GridTopology"**  object of, or deriving from, GridTopology

**obj = "GridTopology"**  object of, or deriving from, GridTopology

**obj = "SpatialPixels"**  object of, or deriving from, SpatialPixels

**obj = "SpatialPixelsDataFrame"**  object of, or deriving from, SpatialPixelsDataFrame

**obj = "SpatialGrid"**  object of, or deriving from, SpatialGrid

**obj = "SpatialGridDataFrame"**  object of, or deriving from, SpatialGridDataFrame

Methods for "coordinates<-">

**object = "data.frame", value="ANY"**  promote data.frame to object of class SpatialPointsDataFrame-class, by specifying coordinates; see coordinates
Description

retrieve or assign coordinate names for classes in \texttt{sp}

Methods for \texttt{coordnames}

\begin{itemize}
  \item \texttt{x = "SpatialPoints"} retrieves coordinate names
  \item \texttt{x = "SpatialLines"} retrieves coordinate names
  \item \texttt{x = "Lines"} retrieves coordinate names
  \item \texttt{x = "Line"} retrieves coordinate names
  \item \texttt{x = "SpatialPolygons"} retrieves coordinate names
  \item \texttt{x = "Polygons"} retrieves coordinate names
  \item \texttt{x = "Polygon"} retrieves coordinate names
\end{itemize}

Methods for \texttt{"coordnames<-"}

\begin{itemize}
  \item \texttt{x = "SpatialPoints", value = "character"} assigns coordinate names
  \item \texttt{x = "SpatialLines", value = "character"} assigns coordinate names
  \item \texttt{x = "Lines", value = "character"} assigns coordinate names
  \item \texttt{x = "Line", value = "character"} assigns coordinate names
  \item \texttt{x = "SpatialPolygons", value = "character"} assigns coordinate names
  \item \texttt{x = "Polygons", value = "character"} assigns coordinate names
  \item \texttt{x = "Polygon", value = "character"} assigns coordinate names
  \item \texttt{x = "GridTopology", value = "character"} assigns coordinate names
  \item \texttt{x = "SpatialGrid", value = "character"} assigns coordinate names
  \item \texttt{x = "SpatialPixels", value = "character"} assigns coordinate names
\end{itemize}

CRS-class

\textit{Class \texttt{"CRS"} of coordinate reference system arguments}

Description

Interface class to the PROJ.4 projection system. The class is defined as an empty stub accepting value \texttt{NA} in the \texttt{sp} package. If the \texttt{rgdal} package is available, then the class will permit spatial data to be associated with coordinate reference systems. The arguments must be entered exactly as in the PROJ.4 documentation, in particular there cannot be any white space in +\texttt{<arg>=<value>} strings, and successive such strings can only be separated by blanks. Note that only +\texttt{+proj=longlat} is accepted for geographical coordinates, which must be ordered (easting, northing).
Usage

CRS(projargs)
identicalCRS(x,y)

Arguments

projargs A character string of projection arguments; the arguments must be entered exactly as in the PROJ.4 documentation; if the projection is unknown, use as character(NA), it may be missing or an empty string of zero length and will then set to the missing value.
x object having a proj4string method, or if y is missing, list with objects that have a proj4string method
y object of class Spatial, or having a proj4string method

Value

CRS returns on success an object of class CRS. identicalCRS returns a logical, indicating whether x and y have identical CRS, or if y is missing whether all objects in list x have identical CRS.

Objects from the Class

Objects can be created by calls of the form CRS("projargs"), where "projargs" is a valid string of PROJ.4 arguments. The initiation function calls the PROJ.4 library to verify the argument set against those known in the library, returning error messages where necessary. The function CRSargs() can be used to show the expanded argument list used by the PROJ.4 library.

Slots

projargs: Object of class "character": projection arguments; the arguments must be entered exactly as in the PROJ.4 documentation, in particular there cannot be any white space in +arg=value strings, and successive such strings can only be separated by blanks.

Methods

show signature(object = "CRS"): print projection arguments in object

Note

Lists of projections may be seen by using the programs installed with the PROJ.4 library, in particular proj and cs2cs; with the latter, -lp lists projections, -le ellipsoids, -lu units, and -ld datum(s) known to the installed software (available in rgdal using projInfo). These are added to in successive releases, so tracking the website or compiling and installing the most recent revisions will give the greatest choice. Finding the very important datum transformation parameters to be given with the +towgs84 tag is a further challenge, and is essential when the datums used in data to be used together differ. Tracing projection arguments is easier now than before the mass ownership of GPS receivers raised the issue of matching coordinates from different argument sets (GPS output and paper map, for example).

                        " +towgs84=565.237,50.0087,465.658,-0.406857,0.350733,-1.87035,4.0812 +units=m"))))  
  print(CRSargs(crs("+init=epsg:28992")))  
}  
# see http://trac.osgeo.org/gdal/ticket/1987
```

degAxis

axis with degrees

Description
draw axes on a plot using degree symbols in numbers

Usage
degAxis(side, at, labels, ...)

Arguments

- **side**: integer; see `axis`
- **at**: numeric; if missing, `axTicks` is called for nice values; see `axis`
- **labels**: character; if omitted labels are constructed with degree symbols, ending in N/S/E/W; in case of negative degrees, sign is reversed and S or W is added; see `axis`
- **...**: passed to the actual `axis` call

Value
axis is plotted on current graph
Note

decimal degrees are used if variation is small, instead of minutes and seconds

Examples

```r
xy <- cbind(x = 2 * runif(100) - 1, y = 2 * runif(100) - 1)
plot(SpatialPoints(xy, proj4string = CRS("+proj=longlat")),xlim=c(-1,1),ylim=c(-1,1))
degAxis(1)
degAxis(2, at = c(-1,-0.5,0,0.5,1))
#
```

Description

retrieves spatial dimensions box from spatial data

Usage

```r
dimensions(obj)
```

Arguments

- `obj` object deriving from class "Spatial"

Value

two-column matrix: the first column has the minimum, the second the maximum values; rows represent the spatial dimensions

Methods

- `obj = "Spatial"` object deriving from class "Spatial"

Examples

```r
# just 9 points on a grid:
x <- c(1,1,1,2,2,3,3,3)
y <- c(1,2,3,1,2,3,1,2,3)
xy <- cbind(x,y)
S <- SpatialPoints(xy)
dimensions(S)

# data.frame
data(meuse.grid)
coordinates(meuse.grid) <- ~x+y
gridded(meuse.grid) <- TRUE
dimensions(meuse.grid)
```
disaggregate-methods  

Disaggregate SpatialLines, SpatialLinesDataFrame, SpatialPolygons, or SpatialPolygonsDataFrame objects

Description

Disaggregate SpatialLines, SpatialLinesDataFrame, SpatialPolygons, or SpatialPolygonsDataFrame objects

Usage

    disaggregate(x, ...)

Arguments

x  
object of class SpatialLines or SpatialPolygons

...  
ignored

Value

object of class SpatialLines or SpatialPolygons, where groups of Line or Polygon are disaggregated to one Line per Lines, or one Polygon per Polygons, respectively.

Author(s)

Robert Hijmans, Edzer Pebesma

Examples

```r
Sr1 = Polygon(cbind(c(2,4,1,2),c(2,3,5,4,2)), hole = FALSE)
Sr2 = Polygon(cbind(c(5,4,2,5),c(2,3,2,2)), hole = FALSE)
Sr3 = Polygon(cbind(c(4,4,5,10,4),c(5,3,2,5,5)), hole = FALSE)
Sr4 = Polygon(cbind(c(5,6,6,5,5),c(4,4,3,3,4)), hole = TRUE)
Srs1 = Polygons(list(Sr1, Sr2), "s1/2")
Srs3 = Polygons(list(Sr3, Sr4), "s3/4")
sp = SpatialPolygons(list(Srs1,Srs3), 1:2)
length(sp) ## [1] 2
length(disaggregate(sp)) ## [1] 3

l1 = cbind(c(1,2,3),c(3,2,2))
l1a = cbind(l1[,1]+.05,l1[,2]+.05)
l2 = cbind(c(1,2,3),c(1,1.5,1))
S11 = Line(l1)
S11a = Line(l1a)
S12 = Line(l2)
S1 = Lines(list(S11, S11a), ID="a")
S2 = Lines(list(S12), ID="b")
s1 = SpatialLines(list(S1,S2))
```
Description
The class provides a container for coordinates stored as degree, minute, decimal second values.

Objects from the Class
Objects can be created by calls of the form `new("DMS", ...),` converted from decimal degrees using `dd2dms()`, or converted from character strings using `char2dms()`.

Slots
- `ws`: Object of class "logical" TRUE if input value negative
- `deg`: Object of class "numeric" degrees
- `min`: Object of class "numeric" minutes
- `sec`: Object of class "numeric" decimal seconds
- `NS`: Object of class "logical" TRUE if input value is a Northing

Methods
- `coerce` signature(`from = "DMS", to = "numeric"`):: convert to decimal degrees
- `show` signature(`object = "DMS"`):: print data values

Author(s)
Roger Bivand <Roger.Bivand@nhh.no>

See Also
- `char2dms`, `dd2dms`

Examples
```r
data(state)
dd2dms(state.center$x)
dd2dms(state.center$y, NS=TRUE)
as.numeric(dd2dms(state.center$y))
as(dd2dms(state.center$y, NS=TRUE), "numeric")
as.numeric.DMS(dd2dms(state.center$y))
state.center$y
```
Description

rearrange SpatialPointsDataFrame for plotting with spplot or levelplot

Usage

```r
flipHorizontal(x)
flipVertical(x)
```

Arguments

- `x`: object of class SpatialGridDataFrame

Value

object of class SpatialGridDataFrame, with pixels flipped horizontally or vertically. Note that the spatial structure is destroyed (or at least: drastically changed).

Author(s)

Michael Sumner

Examples

```r
data(meuse.grid) # data frame
gridded(meuse.grid) = c("x", "y") # promotes to fullgrid(meuse.grid) = TRUE
d = meuse.grid["dist"]
image(d, axes=TRUE)
image(flipHorizontal(d), axes=TRUE)
image(flipVertical(d), axes=TRUE)
```

---

**geometry-methods**

Methods for retrieving the geometry from a composite (geometry + attributes) object

Description

geometry retrieves the SpatialXxx object from a SpatialXxxDataFrame object, with Xxx Lines, Points, Polygons, Grid, or Pixels.
Usage

geography(obj)

Arguments

obj  object of class Spatial

Methods

obj = "Spatial"
obj = "SpatialPointsDataFrame"
obj = "SpatialPolygonsDataFrame"
obj = "SpatialPixelsDataFrame"
obj = "SpatialGridDataFrame"
obj = "SpatialLinesDataFrame"

Author(s)

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>

---

gridded-methods specify spatial data as being gridded, or find out whether they are

Description

returns logical (TRUE or FALSE) telling whether the object is gridded or not; in assignment promotes a non-gridded structure to a gridded one, or demotes a gridded structure back to a non-structured one.

Usage

gridded(obj)
gridded(obj) <- value
fullgrid(obj)
fullgrid(obj) <- value
gridparameters(obj)

Arguments

obj  object deriviving from class "Spatial" (for gridded), or object of class SpatialGridDataFrame-class (for fullgrid and gridparameters)
value  logical replacement values, TRUE or FALSE
Value

if obj derives from class Spatial, gridded(object) will tell whether it is has topology on a regular grid; if assigned TRUE, if the object derives from SpatialPoints and has gridded topology, grid topology will be added to object, and the class of the object will be promoted to SpatialGrid-class or SpatialGridDataFrame-class.

fullgrid returns a logical, telling whether the grid is full and ordered (i.e., in full matrix form), or whether it is not full or unordered (i.e. a list of points that happen to lie on a grid. If assigned, the way the points are stored may be changed. Changing a set of points to full matrix form and back may change the original order of the points, and will remove duplicate points if they were present.

gridparameters returns, if obj inherits from SpatialGridDataFrame its grid parameters, else it returns numeric(0). The returned value is a data.frame with three columns, named cellcentre.offset ("lower left cell centre coordinates"), cellsize, and cells.dim (cell dimension); the rows correspond to the spatial dimensions.

Methods

obj = "Spatial" object deriving from class "Spatial"

Examples

# just 9 points on a grid:
x <- c(1,1,1,2,2,2,3,3,3)
y <- c(1,2,3,1,2,3,1,2,3)
xy <- cbind(x,y)
S <- SpatialPoints(xy)
class(S)
plot(S)
gridded(S) <- TRUE
gridded(S)
class(S)
summary(S)
plot(S)
gridded(S) <- FALSE
gridded(S)
class(S)

# data.frame
data(meuse.grid)
coordinates(meuse.grid) <- ~x+y
grided(meuse.grid) <- TRUE
plot(meuse.grid) # not much good
summary(meuse.grid)
Description

create neighbourhood (nb) object from grid geometry

Usage

gridIndex2nb(obj, maxdist = sqrt(2), fullMat = TRUE, ...)

Arguments

obj object of class SpatialGrid or SpatialPixels
maxdist maximum distance to be considered (inclusive), expressed in number of grid cell
(sqrt(2) results in queen neighbours)
fullMat use dist to compute distances from grid (row/col) indices; FALSE avoids forming
the full distance matrix, at a large performance cost
... arguments passed on to dist

Value

Object of class nb, which is a list.
The nb object follows the convention of nb objects in package spdep; it is a list with each list
element corresponding to a grid cell or pixel; the list element contains the indices of neighbours
defined as cells less than maxdist away, measured in cell unit (N/S/E/W neighbour has distance 1).

Note

Unequal grid cell size is ignored; grid cell row/col indices are taken to be the coordinates from
which distances are computed.

Author(s)

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>

See Also

plot.nb in package spdep

gridlines

Create N-S and E-W grid lines over a geographic region

Description

Create N-S and E-W grid lines over a geographic region; gridat permits the construction of points
and labels for non-projected grid annotation
gridlines

Usage

gridlines(x, easts = pretty(bbox(x)[1,]), norths = pretty(bbox(x)[2,]),
  ndiscr = 20)
girdat(x, easts = pretty(bbox(x)[1,]), norths = pretty(bbox(x)[2,]),
  offset=0.5, side="WS")

Arguments

  x       object deriving from class Spatial-class
  easts   numeric; east-west values for vertical lines
  norths  numeric; north-south values for horizontal lines
  ndiscr  integer; number of points used to discretize the line, could be set to 2, unless the
grid is (re)projected
  offset  offset value to be returned, see text
  side    default “WS”, if “EN” labels placed on the top and right borders

Value

gridlines returns an object of class SpatialLines-class, with lines as specified; the return object
inherits the projection information of x; gridat returns a SpatialPointsDataFrame with points at
the west and south ends of the grid lines created by gridlines, with degree labels

Author(s)

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>, using example code of Roger Bivand.

       pos=grdat_x$pos, offset=grdat_x$offset)
GridTopology-class

Class "GridTopology"

Description

class for defining a rectangular grid of arbitrary dimension

Objects from the Class

Objects are created by using e.g.
GridTopology(c(0,0), c(1,1), c(5,5))

see SpatialGrid

Slots

cellcentre.offset: numeric; vector with the smallest coordinates for each dimension; coordinates refer to the cell centre

cellsize: numeric; vector with the cell size in each dimension

cells.dim: integer; vector with number of cells in each dimension

Methods

coordinates signature(x = "SpatialGrid"): calculates coordinates for each point on the grid

summary signature(object = "SpatialGrid"): summarize object

coerce signature(from = "GridTopology", to = "data.frame"): convert to data.frame with columns cellcentre.offset, cellsize and cells.dim

Author(s)

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>

See Also

SpatialGridDataFrame-class, SpatialGrid-class
Examples

```r
x = GridTopology(c(0,0), c(1,1), c(5,5))
class(x)
x
summary(x)
coordinates(x)
y = SpatialGrid(grid = x)
class(y)
y
```

Description

Convert gridded data in SpatialGridDataFrame to image format; call image on data in SpatialGridDataFrame format. The aspect ratio is set as either 1 for projected data, or stretched by distance from Equator for geographical coordinates.

Usage

```r
## S3 method for class 'SpatialGridDataFrame'
image(x, attr = 1, xcol = 1, ycol = 2,
      col = heat.colors(12), red=NULL, green=NULL, blue=NULL,
      axes = FALSE, xlim = NULL,
      ylim = NULL, add = FALSE, ..., asp = NA, setParUsrBB=FALSE,
      interpolate = FALSE, angle = 0,
      useRasterImage = (!.isSDI() && missing(breaks)), breaks,
      zlim = range(as.numeric(x[[attr]]),is.finite(x[[attr]])))
## S3 method for class 'SpatialPixelsDataFrame'
image(x, ...)
## S3 method for class 'SpatialPixels'
image(x, ...)
## S3 method for class 'SpatialGridDataFrame'
contour(x, attr = 1, xcol = 1, ycol = 2,
       col = 1, add = FALSE, xlim = NULL, ylim = NULL, axes = FALSE,
       ..., setParUsrBB = FALSE)
## S3 method for class 'SpatialPixelsDataFrame'
contour(x, ...)
as.image.SpatialGridDataFrame(x, xcol = 1, ycol = 2, attr = 1)
image2Grid(im, p4 = as.character(NA), digits=10)
```

Arguments

- `x`: object of class `SpatialGridDataFrame`
attr  column of attribute variable; this may be the column name in the data.frame of data (as.data.frame(data)), or a column number

xcol  column number of x-coordinate, in the coordinate matrix

ycol  column number of y-coordinate, in the coordinate matrix

col   a vector of colors

red,green,blue  columns names or numbers given instead of the attr argument when the data represent an image encoded in three colour bands on the 0-255 integer scale; all three columns must be given in this case, and the attribute values will be constructed using function rgb

axes  logical; should coordinate axes be drawn?

xlim  x-axis limits

ylim  y-axis limits

zlim  data limits for plotting the (raster, attribute) values

add  logical; if FALSE, the image is added to the plot layout setup by plot(as(x, "Spatial"),axes=axes,xlim=xlim,which sets up axes and plotting region; if TRUE, the image is added to the existing plot.

...  arguments passed to image, see examples

asp  aspect ratio to be used for plot

setParUsrBB  default FALSE, see Spatial-class for further details

useRasterImage  default !.isSDI() as a workaround for a problem with repeated use in Windows SDI installations; if TRUE, use rasterImage to render the image if available; for legacy rendering set FALSE

breaks  class breaks for coloured values

interpolate  default FALSE, a logical vector (or scalar) indicating whether to apply linear interpolation to the image when drawing, see rasterImage

angle  default 0, angle of rotation (in degrees, anti-clockwise from positive x-axis, about the bottom-left corner), see rasterImage

im  list with components named x, y, and z, as used for image

p4  CRS object, proj4 string

digits  default 10, number of significant digits to use for checking equal row/column spacing

Value

as.image.SpatialGridDataFrame returns the list with elements x and y, containing the coordinates of the cell centres of a matrix z, containing the attribute values in matrix form as needed by image.

Note

Providing xcol and ycol attributes seems obsolete, and it is for 2D data, but it may provide opportunities for plotting certain slices in 3D data. I haven’t given this much thought yet.
filled.contour seems to misinterpret the coordinate values, if we take the image.default manual page as the reference.

image(Rlogo, red="band1", green="band2", blue="band3", add=TRUE)
is.projected

Sets or retrieves projection attributes on classes extending SpatialData

Description

Sets or retrieves projection attributes on classes extending SpatialData; set or retrieve option value for error or warning on exceedance of geographical coordinate range, set or retrieve option value for exceedance tolerance of geographical coordinate range. Note that only "+proj=longlat" is accepted for geographical coordinates, which must be ordered (eastings, northings).

Usage

is.projected(obj)  
proj4string(obj)  
proj4string(obj) <- value  
get_ll_warn()  
get_ll_TOL()  
get_ReplCRS_warn()  
set_ll_warn(value)  
set_ll_TOL(value)  
set_ReplCRS_warn(value)

Arguments

obj  
An object of class or extending Spatial-class
value  
For proj4string CRS object, containing a valid proj4 string; attempts to assign an object containing "longlat" to data extending beyond longitude [-180, 360] or latitude [-90, 90] will be stopped. For set_ll_warn a single logical value, if FALSE (default) error on range exceedance, if TRUE, warning. For set_ll_TOL the value of the power of .Machine$double.eps (default 0.25) to use as tolerance in testing range exceedance. set_ReplCRS_warn may be used to turn off warnings issued when changing object CRS with the proj4string replacement method (by setting value=FALSE).

Details

proj4 strings are operative through CRAN package rgdal. For strings defined as "longlat", the minimum longitude should be -180, the maximum longitude 360, the minimum latitude -90, and the maximum latitude 90. Note that the proj4string replacement method does not project spatial data - for this use spTransform methods in the rgdal package.

Value

is.projected returns a logical; proj4string returns a character vector of length 1: spatial.dimension returns the number of spatial dimensions (2 or 3).

CRS

Line

create objects of class Line or Lines

Description

create objects of class Line or Lines from coordinates

Usage

Line(coords)
Lines(slinelist, ID)

Arguments

coords 2-column numeric matrix with coordinates for a single line
slinelist list with elements of class Line-class
ID a single word unique character identifier, character vector of length one

Value

Line returns an object of class Line-class; Lines returns an object of class Lines-class

See Also

SpatialLines-class

Examples

# from the sp vignette:
l1 = cbind(c(1,2,3),c(3,2,2))
l1a = cbind(l1[,1]+.05,l1[,2]+.05)
l2 = cbind(c(1,2,3),c(1,1.5,1))
S11 = Line(l1)
S11a = Line(l1a)
S12 = Line(l2)
S1 = Lines(list(S11, S11a), ID="a")
S2 = Lines(list(S12), ID="b")
Line-class

Class "Line"

Description

class for line objects

Objects from the Class

Objects can be created by calls of the form new("Line", ...), or (preferred) by calls to the function Line

Slots

coords: Object of class "matrix", containing the line coordinates

Methods

coordinates signature(obj = "Line"): retrieve coordinates from line
lines signature(x = "Line"): add lines to a plot

Author(s)

Roger Bivand, Edzer Pebesma

See Also

Lines-class, SpatialLines-class

---

Lines-class

Class "Lines"

Description

class for sets of line objects

Arguments

SL, Lines: an Lines object

Objects from the Class

Objects can be created by calls to the function Line
Slots

Lines: Object of class "list", containing elements of class Line-class
ID: "character" vector of length one, with unique identifier string

Methods

- **coordinates** signature(obj = "Line"): retrieve coordinates from lines; returns list with matrices
- **lines** signature(x = "Line"): add lines to a plot

Author(s)

Roger Bivand, Edzer Pebesma

Lines-class, SpatialLines-class

loadMeuse: deprecated function to load the Meuse data set

Description

deprecated function to load the Meuse data set

Usage

loadMeuse()

Value

none; it prints a warning to run demo(meuse)

See Also

meuse, meuse.grid

Examples

demo(meuse)
mapasp Calculate aspect ratio for plotting geographic maps; create nice degree axis labels

Description

Calculate aspect ratio for plotting geographic maps; create nice degree axis labels

Usage

mapasp(data, xlim, ylim)
degreeLabelsEW(x)
degreeLabelsNS(x)

Arguments

data object of class or extending Spatial
xlim the xlim argument passed (or derived from bounding box)
ylim the ylim argument passed (or derived from bounding box)
x numeric; values at which tics and marks will be generated

Value

mapasp is used for the aspect argument in lattice plots and spplot;
let x = dy/dx, with dy and dx the y- and x-size of the map.
let s = 1/cos((My * pi)/180) with My the y coordinate of the middle of the map (the mean of ylim)
for latlong (longlat) data, mapasp returns s * x. for other data, mapasp returns "iso".

Note

the values for x are typically obtained from axTicks

See Also

levelplot in package lattice
Merge a Spatial* object having attributes with a data.frame

Description

Merge a Spatial object having a data.frame (i.e. merging of non-spatial attributes).

Usage

```r
## S4 method for signature 'Spatial, data.frame'
merge(x, y, by = intersect(names(x), names(y)),
by.x = by, by.y = by, all.x = TRUE, suffixes = c(".x", ".y"),
incomparables = NULL, duplicateGeoms = FALSE, ...)
```

Arguments

- `x`: object deriving from `Spatial`
- `y`: object of class `data.frame`
- `by`, `by.x`, `by.y`: specifications of the common columns. See 'Details' in (base) `merge`.
- `all.x`: logical; if TRUE, then the returned object will have all rows of `x`, even those that have no matching row in `y`. These rows will have NAs in those columns that are usually filled with values from `y`
- `suffixes`: character(2) specifying the suffixes to be used for making non-by names() unique.
- `incomparables`: values which cannot be matched. See `match`.
- `duplicateGeoms`: logical; if TRUE geometries in `x` are duplicated if there are multiple matches between records in `x` and `y`
- `...`: arguments to be passed to or from methods.

Value

a Spatial* object

Author(s)

Robert J. Hijmans

See Also

`merge`
Description

This data set gives locations and topsoil heavy metal concentrations, along with a number of soil and landscape variables at the observation locations, collected in a flood plain of the river Meuse, near the village of Stein (NL). Heavy metal concentrations are from composite samples of an area of approximately 15 m x 15 m.

Usage

data(meuse)

Format

This data frame contains the following columns:

- x: a numeric vector; Easting (m) in Rijksdriehoek (RDH) (Netherlands topographical) map coordinates
- y: a numeric vector; Northing (m) in RDH coordinates
- cadmium: topsoil cadmium concentration, mg kg-1 soil ("ppm"); zero cadmium values in the original data set have been shifted to 0.2 (half the lowest non-zero value)
- copper: topsoil copper concentration, mg kg-1 soil ("ppm")
- lead: topsoil lead concentration, mg kg-1 soil ("ppm")
- zinc: topsoil zinc concentration, mg kg-1 soil ("ppm")
- elev: relative elevation above local river bed, m
- dist: distance to the Meuse; obtained from the nearest cell in meuse.grid, which in turn was derived by a spread (spatial distance) GIS operation, horizontal precision 20 metres; then normalized to $[0,1]$
- om: organic matter, kg (100 kg)-1 soil (percent)
- ffreq: flooding frequency class: 1 = once in two years; 2 = once in ten years; 3 = one in 50 years
- soil: soil type according to the 1:50 000 soil map of the Netherlands. 1 = Rd10A (Calcarioue weakly-developed meadow soils, light sandy clay); 2 = Rd90C/VII (Non-calcareous weakly-developed meadow soils, heavy sandy clay to light clay); 3 = Bkd26/VII (Red Brick soil, fine-sandy, silty light clay)
- lime: lime class: 0 = absent, 1 = present by field test with 5% HCl
- landuse: landuse class: Aa Agriculture/unspecified = , Ab = Agr/sugar beetsm, Ag = Agr/small grains, Ah = Agr??, Am = Agr/maize, B = woods, Bw = trees in pasture, DEN = ??, Fh = tall fruit trees, Fl = low fruit trees; Fw = fruit trees in pasture, Ga = home gardens, SPO = sport field, STA = stable yard, Tv = ?? , W = pasture
- dist.m: distance to river Meuse in metres, as obtained during the field survey
Note

row.names refer to the original sample number.

Soil units were mapped with a minimum delineation width of 150 m, and so somewhat generalize the landscape.

Approximate equivalent World Reference Base 2002 for Soil Resources names are: Rd10A Gleyic Fluvisols; Rd90C Haplic Fluvisols; Bkd26 Haplic Luvisols. Units Rd90C and Bkd26 have winter groundwater > 80cm, summer > 120cm depth.

Author(s)

Field data were collected by Ruud van Rijn and Mathieu Rikken; compiled for R by Edzer Pebesma; description extended by David Rossiter

meuse.grid Prediction Grid for Meuse Data Set

Description

The meuse.grid data frame has 3103 rows and 7 columns; a grid with 40 m x 40 m spacing that covers the Meuse study area (see meuse)

Usage

    data(meuse.grid)
**Format**

This data frame contains the following columns:

- **x**: a numeric vector; x-coordinate (see `meuse`)
- **y**: a numeric vector; y-coordinate (see `meuse`)
- **dist**: distance to the Meuse river; obtained by a spread (spatial distance) GIS operation, from border of river; normalized to $[0,1]$
- **ffreq**: flooding frequency class, for definitions see this item in `meuse`; it is not known how this map was generated
- **part.a**: arbitrary division of the area in two areas, a and b
- **part.b**: see `part.a`
- **soil**: soil type, for definitions see this item in `meuse`; it is questionable whether these data come from a real soil map, they do not match the published 1:50 000 map

**Details**

x and y are in RD New, the Dutch topographical map coordinate system. Roger Bivand projected this to UTM in the R-Grass interface package.

**Source**

**References**

See the `meuse` documentation

**Examples**

```r
data(meuse.grid)
coordinates(meuse.grid) = ~x+y
proj4string(meuse.grid) <- CRS("+init=epsg:28992")
gridded(meuse.grid) = TRUE
spplot(meuse.grid)
```

---

**Description**

The object contains the meuse.grid data as a SpatialPointsDataFrame after transformation to WGS84 and geographical coordinates.

**Usage**

```r
data(meuse.grid_ll)
```
Format

The format is: Formal class `SpatialPointsDataFrame` [package "sp"].

Source

See the meuse documentation

Examples

data(meuse.grid.ll)

---

meuse.riv | River Meuse outline

Description

The meuse.riv data consists of an outline of the Meuse river in the area a few kilometers around the meuse data set.

The meuse.area polygon has an outline of meuse.grid. See example below how it can be created from meuse.grid.

Usage

data(meuse.riv)
data(meuse.area)

Format

meuse.riv: two-column data.frame containing 176 coordinates.
meuse.area: two-column matrix with coordinates of outline.

Details

x and y are in RDM, the Dutch topographical map coordinate system. See examples of spTransform in the rgdal package for projection parameters.

References

See the meuse documentation
Examples

data(meuse.riv)
plot(meuse.riv, type = "l", asp = 1)
data(meuse.grid)
coordinates(meuse.grid) = c("x", "y")
gridded(meuse.grid) = TRUE
image(meuse.grid, "dist", add = TRUE)
data(meuse)
coordinates(meuse) = c("x", "y")
meuse.sr = SpatialPolygons(list(Polygons(list(Polygon(meuse.riv)),"meuse.riv")))
spplot(meuse.grid, col.regions=bpy.colors(), main = "meuse.grid",
  sp.layout=list(
    list("sp.polygons", meuse.sr),
    list("sp.points", meuse, pch="+", col="black")
  ))
spplot(meuse, "zinc", col.regions=bpy.colors(), main = "zinc, ppm",
  cuts = c(100,200,400,700,1200,2000), key.space = "right",
  sp.layout= list("sp.polygons", meuse.sr, fill = "lightblue")
)

# creating meuse.area from meuse.grid:
if (require(rgeos)) {
  meuse.area = gUnaryUnion(as(meuse.grid, "SpatialPolygons"))
  plot(meuse.area)
}

nowrapSpatialLines  Split SpatialLines components at offset

Description

When recentering a world map, most often from the "Atlantic" view with longitudes with range -180 to 180, to the "pacific" view with longitudes with range 0 to 360, lines crossing the offset (0 for this conversion) get stretched horizontally. This function breaks Line objects at the offset (usually Greenwich), inserting a very small gap, and reassembling the Line objects created as Lines. A similar function for polygons is found in the spgpc package.

Usage

nowrapSpatialLines(obj, offset = 0, eps = rep(.Machine$double.eps, 2))

Arguments

  obj        A Spatial Lines object
  offset     default 0, untried for other values
  eps         vector of two fuzz values, both default double.eps
over-methods

Value

A Spatial Lines object

Author(s)

Roger Bivand

Examples

S1 <- SpatialLines(list(Lines(list(Line(cbind(sin(seq(-4,4,0.4)),
  seq(1,21,1))), "1"))), proj4string=CRS("+proj=longlat"))
summary(S1)
nwSL <- nowrapSpatialLines(S1)
summary(nwSL)

over-methods  consistent spatial overlay for points, grids and polygons

Description

consistent spatial overlay for points, grids and polygons: at the spatial locations of object x retrieves
the indexes or attributes from spatial object y

Usage

over(x, y, returnList = FALSE, fn = NULL, ...)
x %over% y

Arguments

x  geometry (locations) of the queries
y  layer from which the geometries or attributes are queried
returnList  logical; see value
fn  (optional) a function; see value
...  arguments passed on to function fn

Value

If y is only geometry an object of length length(x). If returnList is FALSE, a vector with the
(first) index of y for each geometry (point, grid cell centre, polygon or lines) in x. if returnList is
TRUE, a list of length length(x), with list element i the vector of all indices of the geometries in
y that correspond to the i-th geometry in x.

If y has attribute data, attribute data are returned. returnList is FALSE, a data.frame with
number of rows equal to length(x) is returned, if it is TRUE a list with length(x) elements is
returned, with a list element the data.frame elements of all geometries in y that correspond to that
element of x.
Methods

x = "SpatialPoints", y = "SpatialPolygons" returns a numeric vector of length equal to the number of points; the number is the index (number) of the polygon of y in which a point falls; NA denotes the point does not fall in a polygon; if a point falls in multiple polygons, the last polygon is recorded.

x = "SpatialPointsDataFrame", y = "SpatialPolygons" equal to the previous method, except that an argument fn=xxx is allowed, e.g. fn = mean which will then report a data.frame with the mean attribute values of the x points falling in each polygon (set) of y

x = "SpatialPoints", y = "SpatialPolygonsDataFrame" returns a data.frame of the second argument with row entries corresponding to the first argument

x = "SpatialPolygons", y = "SpatialPoints" returns the polygon index of points in y; if x is a SpatialPolygonsDataFrame, a data.frame with rows from x corresponding to points in y is returned.

x = "SpatialGridDataFrame", y = "SpatialPoints" returns object of class SpatialPointsDataFrame with grid attribute values x at spatial point locations y; NA for NA grid cells or points outside grid, and NA values on NA grid cells.

x = "SpatialGrid", y = "SpatialPoints" returns grid values x at spatial point locations y; NA for NA grid cells or points outside the grid

x = "SpatialPixelsDataFrame", y = "SpatialPoints" returns grid values x at spatial point locations y; NA for NA grid cells or points outside the grid

x = "SpatialPoints", y = "SpatialGrid" xx

Note

over can be seen as a left outer join in SQL; the match is a spatial intersection.

points on a polygon boundary and points corresponding to a polygon vertex are considered to be inside the polygon.

These methods assume that pixels and grid cells are never overlapping; for objects of class SpatialPixels this is not guaranteed.

over methods that involve SpatialLines objects, or pairs of SpatialPolygons are implemented in, package rgeos.

panel.spplot

Description

panel functions for spplot functions, and functions that can be useful within these panel functions.

Usage

spplot.key(sp.layout, rows = 1, cols = 1)
spatialpolygonsrescale(obj, offset, scale = 1, fill = "black", col = "black",
plot.grid = TRUE, ...)
sp.lines(obj, col = 1, ...)
sp.points(obj, pch = 3, ...)
sp.polygons(obj, col = 1, fill = "transparent", ...)
sp.grid(obj, col = 1, alpha = 1, ..., at = pretty(obj[[1]]), col.regions = col)
sp.text(loc, txt, ...)
sp.panel.layout(lst, p.number, ...)
bbexpand(x, fraction)

Arguments

sp.layout list; see spplot for definition
rows integer; panel row(s) for which the layout should be drawn
cols integer; panel column(s) for which the layout should be drawn
obj object of class SpatialPolygons-class for SpatialPolygonsRescale; of class SpatialLines-class, Lines-class or Line-class for sp.lines of a class that has a coordinates-methods for sp.points; of class SpatialPolygons-class for sp.polygons. When obj is character, the actual object is retrieved by get(obj) before its class is evaluated.
offset offset for shifting a Polygons object
scale scale for rescaling
fill fill color
col line color
plot.grid logical: plot through grid functions (TRUE), or through traditional graphics functions (FALSE)
pch plotting character
at numeric; values at which colour breaks should occur
col.regions colours to fill the grid cells, defaults to col
point.in.polygon

loc numeric vector of two elements

txt text to be plotted

alpha alpha (transparency) level

lst sp.layout argument, see spplot

p.number panel number; in a panel, panel.number() should be passed to this argument

x length two numeric vector, containing a range

fraction fraction to expand the range by

... arguments passed to the underlying panel, lattice or grid functions

Note

The panel functions of spplot, panel.gridplot for grids, panel.pointsplot for points, or panel.polygonsplot for lines or polygons can be called with arguments \((x,y,\ldots)\). Customizing spplot plots can be done by extending the panel function, or by supplying an sp.layout argument; see the documentation for spplot. Inside these panel functions, sp.panel.layout is called to deal with plotting the items in a sp.layout object.

spatialpolygonsrescale scales and shifts an object of class SpatialPolygons-class; this is useful e.g. for scale bars, or other layout items.

sp.lines, sp.points, sp.polygons and sp.text plot lines, points, polygons or text in a panel.

spplot.key draws the sp.layout object at given rows/cols.

sp.pagefn can be passed as a page argument, and will call function spplot.key for the last panel drawn on a page.

point.in.polygon \(\) do point(s) fall in a given polygon?

Description

verifies for one or more points whether they fall in a given polygon

Usage

point.in.polygon(point.x, point.y, pol.x, pol.y, mode.checked=FALSE)
Arguments

point.x  numerical array of x-coordinates of points
point.y  numerical array of y-coordinates of points
pol.x   numerical array of x-coordinates of polygon
pol.y   numerical array of y-coordinates of polygon
mode.checked default FALSE, used internally to save time when all the other argument are known to be of storage mode double

Value

integer array; values are: 0: point is strictly exterior to pol; 1: point is strictly interior to pol; 2: point lies on the relative interior of an edge of pol; 3: point is a vertex of pol.

References

Uses the C function InPoly(). InPoly is Copyright (c) 1998 by Joseph O’Rourke. It may be freely redistributed in its entirety provided that this copyright notice is not removed.

Examples

# open polygon:
point.in.polygon(1:10,1:10,c(3,5,5,3),c(3,3,5,5))
# closed polygon:
point.in.polygon(1:10,rep(4,10),c(3,5,5,3),c(3,3,5,5,3))
**polygons**

**Extends**

Class "Line", directly.

**Methods**

No methods defined with class "Polygon" in the signature.

**Author(s)**

Roger Bivand

**See Also**

Polygons-class, SpatialPolygons-class

---

| **polygons** | sets spatial coordinates to create spatial data, or retrieves spatial coordinates |

**Description**

sets spatial coordinates to create spatial data, or retrieves spatial coordinates

**Usage**

polygons(obj)

polygons(object) <- value

**Arguments**

<table>
<thead>
<tr>
<th>obj</th>
<th>object of class &quot;SpatialPolygons&quot; or &quot;SpatialPolygonsDataFrame&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>object of class &quot;data.frame&quot;</td>
</tr>
<tr>
<td>value</td>
<td>object of class &quot;SpatialPolygons&quot;</td>
</tr>
</tbody>
</table>

**Value**

polygons returns the SpatialPolygons of obj; polygons<- promotes a data.frame to a SpatialPolygonsDataFrame object
Examples

```r
grd <- GridTopology(c(1,1), c(1,1), c(10,10))
polys <- as.SpatialPolygons.GridTopology(grd)
centroids <- coordinates(polys)
x <- centroids[,1]
y <- centroids[,2]
z <- 1.4 + 0.1*x + 0.2*y + 0.002*x*y

## Not run

df <- data.frame(x=x, y=y, z=z, row.names=row.names(polys))
polygons(df) <- polys
class(df)
summary(df)
```

---

**Polygons-class**

**Class "Polygons"**

**Description**

Collection of objects of class "Polygon"

**Objects from the Class**

Objects can be created by calls to the function `Polygons`

**Slots**

- **Polygons**: Object of class "list"; list with objects of class `Polygon-class`
- **plotOrder**: Object of class "integer"; order in which the Polygon objects should be plotted, currently by order of decreasing size
- **labpt**: Object of class "numeric"; pair of x, y coordinates giving a label point, the label point of the largest polygon component
- **ID**: Object of class "character"; unique identifier string
- **area**: Object of class "numeric"; the gross total planar area of the Polygon list but not double-counting holes (changed from 0.9-58 - islands are summed, holes are ignored rather than subtracted); these values are used to make sure that polygons of a smaller area are plotted after polygons of a larger area, does not respect projection as objects of this class have no projection defined

**Methods**

No methods defined with class "Polygons" in the signature.
Note

By default, single polygons (where Polygons is a list of length one) are not expected to be holes, but in multiple polygons, hole definitions for member polygons can be set. Polygon objects belonging to an Polygons object should either not overlap one-other, or should be fully included (as lakes or islands in lakes). They should not be self-intersecting. Checking of hole FALSE/TRUE status for Polygons objects is included in the maptools package using functions in the rgeos package, function checkPolygonsHoles().

polygons-methods

Retrieve polygons from SpatialPolygonsDataFrame object

Description

Retrieve polygons from SpatialPolygonsDataFrame object

Methods for polygons

obj = "SpatialPolygons"  object of, or deriving from, SpatialPolygons
obj = "SpatialPolygonsDataFrame"  object of, or deriving from, SpatialPolygonsDataFrame

Methods for "polygons<-"

object = "data.frame", value="SpatialPolygons"  promote data.frame to object of class SpatialPolygonsDataFrame-class, by specifying polygons

read.asciigrid

read/write to/from (ESRI) asciigrid format

Description

read/write to/from ESRI asciigrid format

Usage

read.asciigrid(fname, as.image = FALSE, plot.image = FALSE, colname = fname, proj4string = CRS(as.character(NA)))
write.asciigrid(x, fname, attr = 1, na.value = -9999, ...)

Arguments

fname     file name
as.image  logical; if FALSE, a list is returned, ready to be shown with the image command; if FALSE an object of class SpatialGridDataFrame-class is returned
plot.image logical; if TRUE, an image of the map is plotted
colname   alternative name for data column if not file name
proj4string A CRS object setting the projection arguments of the Spatial Grid returned
x         object of class SpatialGridDataFrame
attr      attribute column; if missing, the first column is taken; a name or a column number may be given
na.value  numeric; value given to missing valued cells in the resulting map
...       arguments passed to write.table, which is used to write the numeric data

Value

read.asciigrid returns the grid map read; either as an object of class SpatialGridDataFrame-class or, if as.image is TRUE, as list with components x, y and z.

Author(s)

Edzer Pebesma

See Also

as.image.SpatialGridDataFrame, image

Examples

x <- read.asciigrid(system.file("external/test.ag", package="sp")[1])
class(x)
image(x)

Description

Methods for function recenter in package sp to shift or re-center geographical coordinates for a Pacific view. All longitudes < 0 are added to 360, to avoid for instance parts of Alaska being represented on the far left and right of a plot because they have values straddling 180 degrees. In general, using a projected coordinate reference system is to be preferred, but this method permits a geographical coordinate reference system to be used. This idea was suggested by Greg Snow, and corresponds to the two world representations in the maps package.
**Methods**

- **obj = "SpatialPolygons"** recenter a SpatialPolygons object
- **obj = "Polygons"** recenter a Polygons object
- **obj = "Polygon"** recenter an Polygon object
- **obj = "SpatialLines"** recenter a SpatialLines object
- **obj = "Lines"** recenter a Lines object
- **obj = "Line"** recenter an Line object

**Examples**

```r
crds <- matrix(c(179, -179, -179, 179, 50, 50, 52, 52), ncol=2)
SL <- SpatialLines(list(Lines(list(Line(crds)), "1")), CRS("+proj=longlat"))
bbox(SL)
SLr <- recenter(SL)
bbox(SLr)
rcrds <- rbind(crds, crds[1,1])
SpP <- SpatialPolygons(list(Polygons(list(Polygon(rcrds)), ID="r1"),
                           proj4string=CRS("+proj=longlat")))
bbox(SpP)
SpPr <- recenter(SpP)
bbox(SpPr)
opar <- par(mfrow=c(1,2))
plot(SpP)
plot(SpPr)
par(opar)
```

select.spatial  select points spatially

Description
select a number of points by digitizing the area they fall in

Usage
select.spatial(data, digitize = TRUE, pch = "+", rownames = FALSE)
Arguments

data data object of class, or extending SpatialPoints; this object knows about its x and y coordinate
digitize logical; if TRUE, points in a digitized polygon are selected; if FALSE, points identified by mouse clicks are selected
pch plotting character used for points
rownames logical; if FALSE, row (coordinate) numbers are returned; if TRUE and data contains a data.frame part, row.names for selected points in the data.frame are returned.

Value

if rownames == FALSE, array with either indexes (row numbers) of points inside the digitized polygon; if rownames == TRUE, character array with corresponding row names in the data.frame part

See Also

point.in.polygon, locator, SpatialPoints-class, SpatialPointsDataFrame-class

# select.spatial(meuse)

sp A package providing classes and methods for spatial data: points, lines, polygons and grids

Description

This package provides S4 classes for importing, manipulating and exporting spatial data in R, and for methods including print/show, plot, subset, [, [[, $, names, dim, summary, and a number of methods specific to spatial data handling.

Introduction

Several spatial statistical packages have been around for a long while, but no organized set of classes for spatial data has yet been devised. Many of the spatial packages make their own assumptions, or use their own class definitions for spatial data, making it inconvenient to move from one package to another. This package tries to provide a solid set of classes for many different types of spatial data. The idea is that spatial statistical packages will either support these classes (i.e., directly read and write them) or will provide conversion to them, so that we have a base class set with which
any package can exchange. This way, many-to-many conversions can be replace with one-to-many conversions, provided either in this package or the spatial packages. Wherever possible conversion (coercion) functions are automatic, or provided by sp.

External packages that depend on sp will provide importing and exporting from and to external GIS formats, e.g. through GDAL, OGR or shapelib.

In addition, this package tries to provide convenient methods to print, summarize and plot such spatial data.

Dimensions

In principal, geographical data are two-dimensional, on a flat surface (a map) or on a sphere (the earth). This package provides space for dealing with higher dimensional data where possible; this is e.g. very simple for points and grids, but hard to do for polygons. Plotting functions are devised primarily for two-dimensional data, or two-dimensional projections of higher dimensional data.

Coordinate reference systems

Central to spatial data is that they have a coordinate reference system, which is coded in object of CRS class. Central to operations on different spatial data sets is that their coordinate reference system is compatible (i.e., identical).

This CRS can be a character string describing a reference system in a way understood by the PROJ.4 projection library, or a (character) missing value. An interface to the PROJ.4 library is available only if the R package rgdal is present.

Class structure

All spatial classes derive from a basic class Spatial, which only provides a bounding box and a CRS. This class has no useful instances, but useful derived classes.

SpatialPoints extends Spatial and has coordinates. The method coordinates extracts the numeric matrix with coordinates from an object of class SpatialPoints, or from other (possibly derived) classes that have points.

Objects of class SpatialGrid points on a regular grid. Either a full grid is stored or a partial grid (i.e., only the non-missing valued cells); calling coordinates on them will give the coordinates for the grid cells.

SpatialPoints, SpatialPixels and SpatialGrid can be of arbitrary dimension, although most of the effort is in making them work for two dimensional data.

SpatialLines provides lines, and SpatialPolygons provides polygons, i.e., lines that end where they start and do not intersect with itself. SpatialLines and SpatialPolygons only have two-dimensional data.

SpatialPointsDataFrame extends SpatialPoints with a data slot, having a data.frame with attribute data. Similarly, SpatialPixelsDataFrame, SpatialLinesDataFrame, SpatialPolygonsDataFrame extend the primary spatial information with attribute data.

Authors

sp is a collaborative effort of Edzer Pebesma, Roger Bivand, Barry Rowlingson and Virgilo Gómez-Rubio.

---

Deprecation

Deprecated functions in sp

Description

Deprecated functions in sp: overlay, getSp*, getPolygon*, getLines*, getSL*

Usage

overlay(x, y, ...)

Arguments

x       first layer
y       second layer, put on top of x
...     optional arguments; see example below

Value

a numerical array of indices of x on locations of y, or a data.frame with (possibly aggregate) properties of x in units of y. (Note that overlay is highly inconsistent, hence its deprecation)

Note

For overlay the new implementation is found in the over method, and works somewhat different (because consistent).

---

Spatial-class

Class "Spatial"

Description

An abstract class from which useful spatial classes are derived

Usage

Spatial(bbox, proj4string = CRS(as.character(NA)))
## S3 method for class 'Spatial'
subset(x, subset, select, drop = FALSE, ...)
Arguments

bbox    a bounding box matrix
proj4string    a CRS object
x    object of class Spatial
subset    see subset.data.frame
select    see subset.data.frame
drop    see subset.data.frame
...    ignored

Objects from the Class

are never to be generated; only derived classes can be meaningful

Slots

bbox: Object of class "matrix"; 2-column matrix holding the minimum in first and maximum in second column for the x-coordinate (first row), y-coordinate (second row) and optionally, for points and grids only, further coordinates. The constructed Spatial object will be invalid if any bbox values are NA or infinite. The column names must be c("min", "max")

proj4string: Object of class "CRS"; holding a valid proj4 string, which can be used for unprojecting or reprojecting coordinates; it is initialised to NA. Other strings are checked for validity in the rgdal package, but attempts to assign a string containing "longlat" to data extending beyond longitude [-180, 360] or latitude [-90, 90] will be stopped or warned, use set.ll_warn to warn rather than stop, and set.ll_tol to change the default tolerance for the range exceedance tests.

Methods

bbox    signature(obj = "Spatial"): retrieves the bbox element
dimensions    signature(obj = "Spatial"): retrieves the number of spatial dimensions spanned
gridded     signature(obj = "Spatial"): logical, tells whether the data is on a regular spatial grid
plot    signature(x = "Spatial", y = "missing"): plot method for spatial objects; does nothing but setting up a plotting region choosing a suitable aspect if not given(see below), colouring the plot background using either a bg= argument or par("bg"), and possibly drawing axes.
summary    signature(object = "Spatial"): summarize object

Warning

this class is not useful in itself, but all spatial classes in this package derive from it
Note

The default aspect for map plots is 1; if however data are not projected (coordinates are longlat), the aspect is by default set to $1/\cos(My \times \pi/180)$ with $My$ the y coordinate of the middle of the map (the mean of ylim, which defaults to the y range of bounding box).

The argument `setParUsrBB` may be used to pass the logical value `TRUE` to functions within `plot.Spatial`. When set to `TRUE`, `par("usr")` will be overwritten with `c(xlim, ylim)`, which defaults to the bounding box of the spatial object. This is only needed in the particular context of graphic output to a specified device with given width and height, to be matched to the spatial object, when using `par("xaxs")` and `par("yaxs")` in addition to `par(mar=c(0,0,0,0))`.

SpatialGrid-class  Class "SpatialGrid"

Description

class for defining a full, rectangular grid of arbitrary dimension

Objects from the Class

Objects are created by using e.g.

```r
SpatialGrid(grid)
```

with grid of class GridTopology-class

Slots

```
grid  object of class GridTopology-class, defining the grid topology (offset, cellsize, dim)
bbox: Object of class "matrix": bounding box
proj4string: Object of class "CRS": projection
```

Extends

Class "SpatialPoints" directly; Class "Spatial", by class "SpatialPoints".
Methods

coordinates signature(x = "SpatialGrid"): calculates coordinates for each point on the grid; coordinates are not stored in objects of class SpatialGrid

summary signature(object = "SpatialGrid"): summarize object

plot signature(x = "SpatialGrid"): plots cell centers

"[" signature(x = "SpatialGrid"): select rows and columns

Author(s)

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>

See Also

SpatialGridDataFrame-class, SpatialGrid

Examples

x <- GridTopology(c(0,0), c(1,1), c(5,5))
class(x)
x
summary(x)
coordinates(x)
y <- SpatialGrid(grid = x)
class(y)
y

SpatialGridDataFrame-class

Class "SpatialGridDataFrame"

Description

Class for spatial attributes that have spatial locations on a (full) regular grid.

Objects from the Class

Objects can be created by calls of the form as(x,"SpatialGridDataFrame"), where x is of class SpatialPixelsDataFrame-class, or by importing through rgdal. Ordered full grids are stored instead or unordered non-NA cells;

Slots

grid: see GridTopology-class; grid parameters
bbox: Object of class "matrix": bounding box
proj4string: Object of class "CRS": projection
data: Object of class data.frame, containing attribute data
Extends

Class "SpatialGrid", directly. Class "Spatial", by class "SpatialGrid".

Methods

coordinates signature(x = "SpatialGridDataFrame"): retrieves (and calculates!) coordinates
[ signature(x = "SpatialGridDataFrame"): selects rows, columns, and attributes; returns an
object of class SpatialGridDataFrame

as.matrix signature(x = "SpatialGridDataFrame"): coerce to matrix; increasing col index
corresponds to decreasing y coordinate, row index increases with coordinate index

as.array signature(x = "SpatialGridDataFrame"): coerce to array; increasing array index for
the second dimension corresponds to decreasing coordinates, all other coordinate dimensions
increase with array index

cbind signature(...): if arguments have identical topology, combine their attribute values

Author(s)

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>

SpatialGrid-class, which does not contain the attribute data, and SpatialPixelsDataFrame-class which holds possible
grids

Examples

data(meuse.grid) # only the non-missing valued cells
coordinates(meuse.grid) = c("x", "y") # promote to SpatialPointsDataFrame
gridded(meuse.grid) <- TRUE # promote to SpatialPixelsDataFrame
x = as(meuse.grid, "SpatialGridDataFrame") # creates the full grid
x["idist"] = 1 - x["dist"]] # assigns new attribute
image(x["idist"]) # note the single [ for attribute selection

# toy example:
df = data.frame(z = c(1:6,NA,8,9),
   xc = c(1,1,1,2,2,2,3,3,3),
   yc = c(rep(c(0, 1.5, 3),3)))
coordinates(df) = ~xc+yc
gridded(df) = TRUE
df = as(df, "SpatialGridDataFrame") # to full grid
image(df["z"]) # draw labels to verify:
cc = coordinates(df)
z=df["z"]
zc=as.character(z)
zc[is.na(zc)]="NA"
text(cc[,1],cc[,2],zc)

# the following is weird, but illustrates the concept of row/col selection:
fullgrid(meuse.grid) = TRUE
SpatialLines

create objects of class SpatialLines or SpatialLinesDataFrame

Description

create objects of class SpatialLines or SpatialLinesDataFrame from lists of Lines objects and
data.frames; extract list od Lines from a SpatialLines object

Usage

SpatialLines(LinesList, proj4string = CRS(as.character(NA)))
SpatialLinesDataFrame(sl, data, match.ID = TRUE)
as.SpatialLines.SLDF(SLDF)
getSpatialLinesMidPoints(SL)
LineLength(cc, longlat=FALSE, sum=TRUE)
LinesLength(Ls, longlat=FALSE)
SpatialLinesLengths(SL, longlat)

Arguments

LinesList list with objects of class Lines-class
proj4string Object of class "CRS"; holding a valid proj4 string
sl, SL object of class SpatialLines-class
data object of class data.frame, the number of rows in data should equal the number of Lines elements in sl
match.ID logical: (default TRUE): match SpatialLines member Lines ID slot values with data.frame row names, and re-order the data frame rows if necessary; if character: indicates the column in data with Lines IDs to match
SLDF SpatialLinesDataFrame object
Ls Object of class Lines
cc Object of class Line, or two-column matrix with points
longlat if FALSE, Euclidean distance, if TRUE Great Circle distance in kilometers
sum default return scalar length of sum of segments in Line, if FALSE, return vector of segment lengths
Value

SpatialLines returns object of class SpatialLines; SpatialLinesDataFrame returns object of class SpatialLinesDataFrame getSpatialLinesMidPoints returns an object of class SpatialPoints, each point containing the (weighted) mean of the lines elements; weighted in the sense that mean is called twice.

See Also

SpatialLines-class

SpatialLines-class 

a class for spatial lines

Description

a class that holds spatial lines

Objects from the Class

hold a list of Lines objects; each Lines object holds a list of Line (line) objects.

Slots

lines: Object of class "list"; list members are all of class Lines-class
bbox: Object of class "matrix"; see Spatial-class
proj4string: Object of class "CRS"; see CRS-class

Extends

Class "Spatial", directly.

Methods

[ signature(obj = "SpatialLines"): select subset of (sets of) lines; NAs are not permitted in the row index
coordinates value is a list of lists with matrices
plot signature(x = "SpatialLines", y = "missing"): plot lines in SpatialLines object
lines signature(x = "SpatialLines"): add lines in SpatialLines object to a plot
rbind signature(object = "SpatialLines"): rbind-like method, see notes
summary signature(object = "SpatialLines"): summarize object

Note

rbind calls the function SpatialLines, where it is checked that all IDs are unique. If rbind-ing SpatialLines without unique IDs, it is possible to set the argument makeUniqueIDs = TRUE, although it is preferred to change these explicitly with spChFIDs.
**SpatialLinesDataFrame-class**

*a class for spatial lines with attributes*

**Description**

this class holds data consisting of (sets of lines), where each set of lines relates to an attribute row in a data.frame

**Objects from the Class**

can be created by the function `SpatialLinesDataFrame`

**Slots**

- **data**: Object of class `data.frame` containing the attribute table
- **lines**: Object of class "list"; see `SpatialLines-class`
- **bbox**: Object of class "matrix"; see `Spatial-class`
- **proj4string**: Object of class "CRS"; see `CRS-class`

**Extends**

Class "SpatialLines", directly. Class "Spatial", by class "SpatialLines".

---

**Author(s)**

Roger Bivand, Edzer Pebesma

**See Also**

`Line-class`, `Lines-class`

**Examples**

```r
# from the sp vignette:
l1 = cbind(c(1,2,3),c(3,2,2))
l1a = cbind(l1[,1]+.05,l1[,2]+.05)
l2 = cbind(c(1,2,3),c(1,1.5,1))
S11 = Line(l1)
S11a = Line(l1a)
S12 = Line(l2)
S1 = Lines(list(S11, S11a), ID="a")
S2 = Lines(list(S12), ID="b")
S1 = SpatialLines(list(S1, S2))
summary(S1)
plot(S1, col = c("red", "blue"))
```
SpatialPixels

Methods

Methods defined with class "SpatialLinesDataFrame" in the signature:

[ signature(x = "SpatialLinesDataFrame"): subset rows or columns; in case of row subsetting, the line sets are also subsetted; NAs are not permitted in the row index
coordinates signature(obj = "SpatialLinesDataFrame"): retrieves a list with lists of coordinate matrices
show signature(object = "SpatialLinesDataFrame"): print method
plot signature(x = "SpatialLinesDataFrame"): plot points
lines signature(object = "SpatialLinesDataFrame"): add lines to plot
rbind signature(object = "SpatialLinesDataFrame"): rbind-like method

Note

rbind for SpatialLinesDataFrame is only possible for objects with unique IDs. If you want to rbind objects with duplicated IDs, see spChFIDs.

SpatialLines-class

Description

defines spatial grid by offset, cell size and dimensions

Usage

GridTopology(cellcentre.offset, cellsize, cells.dim)
SpatialPixels(points, tolerance = sqrt(.Machine$double.eps), proj4string = CRS(as.character(NA)), round = NULL, grid = NULL)
SpatialGrid(grid, proj4string = CRS(as.character(NA))
coordinatevalues(obj)
points2grid(points, tolerance = sqrt(.Machine$double.eps), round=NULL)
getGridIndex(cc, grid, all.inside = TRUE)
getGridTopology(obj)
areaSpatialGrid(obj)
**Arguments**

- **cellcentre.offset**  
  numeric; vector with the smallest coordinates for each dimension

- **cellsize**  
  numeric; vector with the cell size in each dimension

- **cells.dim**  
  integer; vector with number of cells in each dimension

- **points**  
  coordinates, object of class *SpatialPoints-class*

- **grid**  
  grid topology; object of class *GridTopology-class*; for calls to `SpatialPixels`, a value of NULL implies that this will be derived from the point coordinates

- **tolerance**  
  precision, used to which extent points are exactly on a grid

- **round**  
  default NULL, otherwise a value passed to as the digits argument to `round` for setting cell size

- **proj4string**  
  object of class *CRS-class*

- **obj**  
  object of class or deriving from *SpatialGrid-class*

- **cc**  
  numeric matrix with coordinates

- **all.inside**  
  logical; if TRUE and cc points fall outside the grid area, an error message is generated; if FALSE, NA values are generated for such points

**Value**

- GridTopology returns a value of class *GridTopology-class*; SpatialGrid returns an object of class *SpatialGrid-class*

- `coordinatevalues` returns a list with the unique x-coordinates, the unique y-coordinate, etc. instead of the coordinates of all grid cells

- SpatialGrid returns an object of class *SpatialGrid-class*.

- `points2grid` returns the *GridTopology-class* from a set of points.

- `getGridIndex` finds the index of a set of point coordinates in a given grid topology, and depending on all.inside setting, generates NA or an error message if points are outside the grid domain.

- `getGridTopology` returns the slot of class *GridTopology-class* from obj.

- `areaSpatialGrid` returns the spatial area of (the non-missing valued cells of) the grid. For objects of class *SpatialGridDataFrame-class* the area refers to cells where any (one or more) of the attribute columns are non-missing valued.

**Note**

- SpatialGrid stores grid topology and may or may not store the coordinates of the actual points, which may form a subset of the full grid. To find out or change this, see `fullgrid`.

- `points2grid` tries to figure out the grid topology from points. It succeeds only if points on a grid line have constant y column, and points on a grid column have constant x coordinate, etc. In other cases, use `signif` on the raw coordinate matrices to make sure this is the case.

**Author(s)**

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>
**SpatialPixels-class**

**Description**

class for defining a pixels, forming a possibly incomplete rectangular grid of arbitrary dimension

**Examples**

```r
x = GridTopology(c(0,0), c(1,1), c(5,4))
class(x)
x
summary(x)
coordinates(x)
coordinates(GridTopology(c(0,0), c(1,1), c(5,4)))
coordinatevalues(x)
data(meuse.grid)
coordinates(meuse.grid) <- c("x", "y")
points2grid(meuse.grid)
data(meuse.grid)
set.seed(1)
meuse.grid$x <- meuse.grid$x + rnorm(length(meuse.grid$x), 0, 0.002)
meuse.grid$y <- meuse.grid$y + rnorm(length(meuse.grid$y), 0, 0.002)
coordinates(meuse.grid) <- c("x", "y")
# EJP
# points2grid(meuse.grid, tolerance=0.76, round=1)
data(meuse.grid)
a <- which(meuse.grid$x == 180140)
b <- which(meuse.grid$x == 180180)
c <- which(meuse.grid$x == 179260)
d <- which(meuse.grid$y == 332460)
e <- which(meuse.grid$y == 332420)
f <- which(meuse.grid$y == 330740)
meuse.grid <- meuse.grid[-c(a, b, c, d, e, f),]
coordinates(meuse.grid) <- c("x", "y")
points2grid(meuse.grid)
data(meuse.grid)
set.seed(1)
meuse.grid$x <- meuse.grid$x + rnorm(length(meuse.grid$x), 0, 0.002)
meuse.grid$y <- meuse.grid$y + rnorm(length(meuse.grid$y), 0, 0.002)
meuse.grid <- meuse.grid[-c(a, b, c, d, e, f),]
coordinates(me.use.grid) <- c("x", "y")
# EJP
# points2grid(meuse.grid, tolerance=0.69, round=1)
```
**Objects from the Class**

Objects are created by using e.g. `SpatialPixels(points)` with points of class `SpatialPoints-class`

**Slots**

- grid  object of class `GridTopology-class`, defining the grid topology (offset, cellsize, dim)
- grid.index integer; index of points in full grid
- coords coordinates of points, or bbox of grid
- bbox: Object of class "matrix"; bounding box
- proj4string: Object of class "CRS"; projection

**Extends**

Class "SpatialPoints" directly; Class "Spatial", by class "SpatialPoints".

**Methods**

- `coordinates` signature(e = "SpatialPixels"): calculates coordinates for each point on the grid; coordinates are not stored in objects of class `SpatialGrid`
- `summary` signature(object = "SpatialPixels"): summarize object
- `plot` signature(x = "SpatialPixels"): plots cell centers
- `"["` signature(x = "SpatialPixels"): select pixel cells; the argument drop=False (default) does not recalculate grid topology for the selection, if drop=TRUE the grid topology is recomputed, and might change.
- `rbind` signature(x = "SpatialPixels"): rbind-like method

**Author(s)**

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>

**See Also**

`SpatialPixelsDataFrame-class`, `SpatialGrid-class`

**Examples**

```r
data(meuse.grid)
pts = meuse.grid[cbind("x", "y")]
y = SpatialPixels(SpatialPoints(pts))
class(y)
y
summary(y)
plot(y)
```
SpatialPixelsDataFrame

*define spatial grid with attribute data*

**Description**

defines spatial grid by offset, cell size and dimensions

**Usage**

```r
SpatialPixelsDataFrame(points, data, tolerance = sqrt(.Machine$double.eps),
proj4string = CRS(as.character(NA)), round = NULL, grid = NULL)
SpatialGridDataFrame(grid, data, proj4string = CRS(as.character(NA)))
```

**Arguments**

- `points`: coordinates, either as numeric matrix or as object of class `SpatialPoints-class`
- `grid`: grid topology; object of class `GridTopology-class`; for calls to `SpatialPixelsDataFrame` a value of NULL implies that this will be derived from the point coordinates
- `data`: data.frame; contains the attribute (actual grid) data
- `tolerance`: precision up to which extent points should be exactly on a grid
- `round`: default NULL, otherwise a value passed to as the digits argument to `round` for setting cell size
- `proj4string`: object of class `CRS-class` in the first form only used when points does not inherit from `Spatial-class`

**Value**

SpatialPixelsDataFrame returns an object of class `SpatialPixelsDataFrame-class`; SpatialGridDataFrame returns an object of class `SpatialGridDataFrame-class`.

**Note**

SpatialPixels stores grid topology and coordinates of the actual points, which may be in the form of a subset (set of pixels) of a full grid. To find out or change this, see `fullgrid` and `SpatialGrid-class`.

**Author(s)**

Edzer Pebesma

**See Also**

`gridded`, `gridded<-`, `SpatialGrid`, `SpatialGrid-class`
Examples

m = SpatialPixelsDataFrame(points = meuse.grid[,c("x", "y")], data = meuse.grid)
class(m)
summary(m)

SpatialPixelsDataFrame-class

Class "SpatialPixelsDataFrame"

Description

Class for spatial attributes that have spatial locations on a regular grid.

Objects from the Class

Objects can be created by calls of the form as(x,"SpatialPixelsDataFrame"), where x is of class SpatialPointsDataFrame-class, or by importing through rgdal. Ordered full grids are stored instead of unordered non-NA cells;

Slots

bbox: Object of class "matrix"; bounding box
proj4string: Object of class "CRS"; projection
coords: see SpatialPoints; points slot
coords.nrs see SpatialPointsDataFrame
grid: see GridTopology-class; grid parameters
grid.index: integer; index of points in the list to points in the full (ordered) grid. x cycles fastest; all coordinates increase from low to hight except y, which decreases from high to low
data: Object of class data.frame, containing the attribute data

Extends

Class "SpatialPixels", directly. Class "Spatial", by class "SpatialPixels".

Methods

coordinates signature(x = "SpatialPixelsDataFrame"): retrieves coordinates
[ signature(x = "SpatialPixelsDataFrame"): selects row(s) and/or attribute(s), and returns an object of class SpatialPixelsDataFrame; rows refer here to the pixel numbers, not grid lines. For selecting a square block in a grid, coerce to a SpatialGridDataFrame-class first, and use [ on that object
as.matrix signature(x = "SpatialPixelsDataFrame"): coerce to matrix
rbind signature(x = "SpatialPixelsDataFrame"): rbind-like method
**SpatialPoints**

*create objects of class SpatialPoints or SpatialPointsDataFrame*

**Description**

create objects of class `SpatialPoints-class` or `SpatialPointsDataFrame-class` from coordinates, and from coordinates and data.frames

**Usage**

```
SpatialPoints(coords, proj4string=CRS(as.character(NA)), bbox = NULL)
SpatialPointsDataFrame(coords, data, coords.nrs = numeric(0),
                      proj4string = CRS(as.character(NA)), match.ID = TRUE, bbox = NULL)
```

**Examples**

```
data(meuse.grid) # only the non-missing valued cells
coordinates(meuse.grid) = c("x", "y") # promote to SpatialPointsDataFrame
gridded(meuse.grid) <- TRUE # promote to SpatialPixelsDataFrame
meuse.grid["dist"] = 1 - meuse.grid["dist"] # assigns new attribute
image(meuse.grid["dist"])) # note the single [

# toy example:
df = data.frame(z = c(1:6,NA,8,9),
  xc = c(1,1,1,2,2,2,3,3,3),
  yc = c(rep(c(0, 1.5, 3),3)))
coordinates(df) = ~xc+yc
gridded(df) = TRUE
image(df["z"]) # draw labels to verify:
cc = coordinates(df)
z=df["z"]
zc=as.character(z)
zc[is.na(zc)]="NA"
text(cc[,1],cc[,2],zc)
```
**SpatialPoints-class**

**Arguments**

- **coords**: numeric matrix or data.frame with coordinates (each row is a point); in case of SpatialPointsDataFrame an object of class SpatialPoints-class is also allowed.
- **proj4string**: projection string of class CRS-class.
- **bbox**: bounding box matrix, usually NULL and constructed from the data, but may be passed through for coercion purposes if clearly needed.
- **data**: object of class data.frame; the number of rows in data should equal the number of points in the coords object.
- **coords.nrs**: numeric; if present, records the column positions where in data the coordinates were taken from (used by coordinates<-).
- **match.ID**: logical; if TRUE AND coords has rownames (i.e., coerced to a matrix, dimnames(coords)[[2]] is not NULL), AND data has row.names (i.e., is a data.frame), then the SpatialPointsDataFrame object is formed by matching the row names of both components, leaving the order of the coordinates in tact. Checks are done to see whether both row names are sufficiently unique, and all data are matched. If FALSE, coordinates and data are simply "glued" together. If character: indicates the column in data with coordinates IDs to match.

**Value**

SpatialPoints returns an object of class SpatialPoints; SpatialPointsDataFrame returns an object of class SpatialPointsDataFrame.

**See Also**

coordinates, SpatialPoints-class, SpatialPointsDataFrame-class

---

**SpatialPoints-class**

Class "SpatialPoints"

**Description**

Class for (irregularly spaced) points.

**Objects from the Class**

Objects can be created by calls of the form SpatialPoints(x).

**Slots**

- **coords**: Object of class "matrix", containing the coordinates (each row is a point).
- **bbox**: Object of class "matrix", with bounding box.
- **proj4string**: Object of class "CRS", projection string.
Extends
Class "Spatial", directly.

Methods

[ signature(x = "SpatialPoints"): subsets the points; only rows can be subsetted
coerce signature(from = "SpatialPoints", to = "data.frame"): retrieves the data part
coerce signature(from = "SpatialPoints", to = "SpatialPixels"): equivalent to assigning gridded TRUE for a copy of the object
coerce signature(from = "SpatialPointsDataFrame", to = "SpatialPixelsDataFrame"): equivalent to assigning gridded TRUE for a copy of the object
coerce signature(from = "data.frame", to = "SpatialPoints"): sets coordinates, which may be in a data frame
coerce signature(from = "matrix", to = "SpatialPoints"): set coordinates, which may be in a matrix
coordinates signature(obj = "SpatialPoints"): retrieves the coordinates, as matrix
plot signature(x = "SpatialPoints", y = "missing"): plot points
summary signature(object = "SpatialPoints"): summarize object
points signature(x = "SpatialPoints"): add point symbols to plot
show signature(object = "SpatialPoints"): prints coordinates
rbind signature(object = "SpatialPoints"): rbind-like method

Author(s)
Edzer Pebesma, <edzer.pebesma@uni-muenster.de>

SpatialPointsDataFrame-class

Examples

x = c(1,2,3,4,5)
y = c(3,2,5,1,4)
S <- SpatialPoints(cbind(x,y))
S <- SpatialPoints(list(x,y))
S <- SpatialPoints(data.frame(x,y))
plot(S)
SpatialPointsDataFrame-class

Class "SpatialPointsDataFrame"

Description

Class for spatial attributes that have spatial point locations

Usage

```r
## S4 method for signature 'SpatialPointsDataFrame'
X[i, j, ..., drop = TRUE]
## S4 method for signature 'SpatialPointsDataFrame,SpatialPoints'
coerce(from, to, strict=TRUE)
## S4 method for signature 'SpatialPointsDataFrame,data.frame'
coerce(from, to, strict=TRUE)
## S4 method for signature 'SpatialPointsDataFrame'
coordinates(obj)
## S4 method for signature 'SpatialPointsDataFrame'
show(object)
## S4 method for signature 'SpatialPointsDataFrame'
points(X)
## S3 method for class 'SpatialPointsDataFrame'
rbind(...)```

Arguments

- `x`: SpatialPointsDataFrame object
- `from`: class to which to coerce
- `obj`: object
- `object`: SpatialPointsDataFrame object
- `strict`: see `as`
- `i`: row indices
- `j`: column indices
- `drop`: see `Extract`
- `...`: indices passed through

Objects from the Class

Objects can be created by calls of the form `coordinates(x) = c("x", "y")` or of the form `coordinates(x) = xy`; see `coordinates`. 
SpatialPointsDataFrame-class

Slots

data: Object of class data.frame containing the attribute data (may or may not contain the coordinates in its columns)

coords: Object of class "matrix": the coordinates matrix (points are rows in the matrix)

coords.nrs Object of class logical; if TRUE, when the object was created the coordinates were retrieved from the data.frame, and hence stripped from it; after coercion to data.frame, e.g. by as.data.frame(x), coordinates will again be added (as first few columns) to the data.frame

bbox: Object of class "matrix": bounding box

proj4string: Object of class "CRS": projection string

Extends

Class "SpatialPoints", directly. Class "Spatial", by class "SpatialPoints".

Author(s)

Edzer Pebesma, <edzer.pebesma@uni-muenster.de>

class(meuse)

data(meuse) # reload data.frame
goal: coordinates(meuse) = c(1, 2) # specify column names
class(meuse)

data(meuse) # reload data.frame
goal: coordinates(meuse) = ~x+y # formula
class(meuse)

data(meuse) # reload data.frame
goal: coordinates(meuse) = xy # as data frame
class(meuse)

data(meuse) # reload data.frame
goal: coordinates(meuse) = as.matrix(xy) # as matrix

eqc\$log.zn = log(eqc\$zinc)
class(eqc)

dim(eqc)
SpatialPolygons

create objects of class SpatialPolygons or SpatialPolygonsDataFrame from lists of Polygons objects and data.frames

Usage

```r
Polygon(coords, hole=as.logical(NA))
Polygons(srl, ID)
SpatialPolygons(srl, p0, proj4string=CRS(as.character(NA)))
SpatialPolygonsDataFrame(Sr, data, match.ID = TRUE)
getSpatialPolygonsLabelPoints(SP)
```

Arguments

- **coords**: 2-column numeric matrix with coordinates; first point (row) should equal last coordinates (row); if the hole argument is not given, the status of the polygon as a hole or an island will be taken from the ring direction, with clockwise meaning island, and counter-clockwise meaning hole.
- **hole**: logical value for setting polygon as hole or not; if the hole argument is not given, the status of the polygon as a hole or an island will be taken from the ring direction, with clockwise meaning island, and counter-clockwise meaning hole.
- **proj4string**: projection string of class CRS-class.
- **srl**: list with Polygon-class objects.
- **ID**: character vector of length one with identifier.
- **Sr**: list with objects of class Polygons-class.
- **p0**: integer vector; plotting order; if missing in reverse order of Polygons area.
- **Sr**: object of class SpatialPolygons-class.
- **data**: object of class data.frame; the number of rows in data should equal the number of Polygons-class objects in Sr.
- **match.ID**: logical: (default TRUE): match SpatialPolygons member Polygons ID slot values with data frame row names, and re-order the data frame rows if necessary. If character: indicates the column in data with Polygons IDs to match.
- **SP**: object of class SpatialPolygons-class.
Details

In Polygon, if the hole argument is not given, the status of the polygon as a hole or an island will be taken from the ring direction, with clockwise meaning island, and counter-clockwise meaning hole. In Polygons, if all of the member Polygon objects are holes, the largest by area will be converted to island status. Until 2010-04-17, version 0.9-61, the area of this converted object was erroneously left at its hole value of zero. Thanks to Patrick Giraudoux for spotting the bug.

The class definitions used for polygons in sp do not accord with those of the simple features specification of the Open Geospatial Consortium. The rgeos package, an interface to Geometry Engine – Open Source (GEOS), uses this specification, in which each hole (interior ring) must be associated with its containing exterior ring. In order to avoid introducing incompatible changes into the class definition of Polygons objects, a comment has been added as a single character string to each such object. Here we can trust the data source to assign the hole status correctly, and use the simple function createSPComment to add such comments to each Polygons member of the polygons slot of this SpatialPolygons object. Exterior rings are coded zero, while interior rings are coded with the 1-based index of the exterior ring to which they belong. SpatialPolygons objects created by reading using readOGR from rgdal have the comments set on input, as OGR also uses SFS.

Value

Polygon returns an object of class Polygon; Polygons returns an object of class Polygons; SpatialPolygons returns object of class SpatialPolygons; SpatialPolygonsDataFrame returns object of class SpatialPolygonsDataFrame getSpatialPolygonsLabelPoints returns an object of class SpatialPoints with label points.

See Also

SpatialPolygons-class, SpatialPolygonsDataFrame-class
density  default NULL; the density of shading lines, in lines per inch, see polygon
angle  default 45; the slope of shading lines, given as an angle in degrees (counter-clockwise), see polygon
pbg  default NULL, set to par("bg") by default “transparent”; the colour to paint holes
axes  default FALSE; draw axes
lty  default par("lty"); border line type
... other arguments passed through
setParUsrBB  default FALSE; see Spatial-class for further details
usePolypath  default NULL to set from option value; use polypath for hole-handling in plot
rule  default NULL to set from option value; character value specifying the path fill mode, see polypath

The options for usePolypath and rule may be retrieved with get_Polypath (default TRUE on package load) and get_PolypathRule (default “winding” on package load), and set with set_Polypath and set_PolypathRule

The class definitions used for polygons in sp do not accord with those of the simple features specification of the Open Geospatial Consortium. The rgeos package, an interface to Geometry Engine – Open Source (GEOS), uses this specification, in which each hole (interior ring) must be associated with its containing exterior ring. In order to avoid introducing incompatible changes into the class definition of Polygons objects, a comment has been added as a single character string to each such object. Here we can trust the data source to assign the hole status correctly, and use the simple function createSPComment to add such comments to each Polygons member of the polygons slot of this SpatialPolygons object. Exterior rings are coded zero, while interior rings are coded with the 1-based index of the exterior ring to which they belong. SpatialPolygons objects created by reading using readOGR from rgdal have the comments set on input, as OGR also uses SFS.

Objects from the Class
Objects can be created by calls to the function SpatialPolygons

Slots
polygons: Object of class "list"; list elements are all of class Polygons-class
plotOrder: Object of class "integer"; integer array giving the order in which objects should be plotted
bbox: Object of class "matrix"; see Spatial-class
proj4string: Object of class "CRS"; see CRS-class

Extends
Class "Spatial", directly.
SpatialPolygons-class

Methods

Methods defined with class "SpatialPolygons" in the signature:

- \[ \text{signature(obj = "SpatialPolygons")}: \text{select subset of (sets of) polygons; NAs are not permitted in the row index} \]
- \text{plot signature(x = "SpatialPolygons", y = "missing")}: \text{plot polygons in SpatialPolygons object} \]
- \text{summary signature(object = "SpatialPolygons")}: \text{summarize object} \]
- \text{rbind signature(object = "SpatialPolygons")}: rbind-like method

Note

rbind calls the function \text{SpatialPolygons}, where it is checked that all IDs are unique. If rbind-ing SpatialPolygons without unique IDs, it is possible to set the argument makeUniqueIDs = TRUE, although it is preferred to change these explicitly with spChFIDs.

Srl = Polygon(cbind(c(2,4,4,1,2),c(2,3,5,4,2)))
Srl2 = Polygon(cbind(c(2,4,2,5),c(2,3,2,2)))
Srl3 = Polygon(cbind(c(4,4,5,10,4),c(5,3,2,5,5)))
Srl4 = Polygon(cbind(c(5,6,6,5,5),c(4,43,3,4)), hole = TRUE)
Srs1 = Polygons(list(Srl), "s1")
Srs2 = Polygons(list(Srl2), "s2")
Srs3 = Polygons(list(Srl3, Srl4), "s3/4")
SpP = SpatialPolygons(list(Srs1,Srs2,Srs3), 1:3)
plot(SpP, col = 1:3, pbg="white")
grd <- GridTopology(c(1,1), c(1,1), c(10,10))
polys <- as(grd, "SpatialPolygons")
plot(polys)
text(coordinates(polys), labels=row.names(polys))
SpatialPolygonsDataFrame-class

Class "SpatialPolygonsDataFrame"

Description

class to hold polygons with attributes

Objects from the Class

Objects can be created by calls to the function SpatialPolygonsDataFrame

Slots

data: Object of class "data.frame"; attribute table
polygons: Object of class "list"; see SpatialPolygons-class
plotOrder: Object of class "integer"; see SpatialPolygons-class
bbox: Object of class "matrix"; see Spatial-class
proj4string: Object of class "CRS"; see CRS-class

Extends

Class "SpatialPolygons", directly. Class "Spatial", by class "SpatialPolygons".

Methods

Methods defined with class "SpatialPolygonsDataFrame" in the signature:

[ signature(x = "SpatialPolygonsDataFrame") : select subset of (sets of) polygons; NAs are 
  not permitted in the row index
rbind signature(object = "SpatialPolygonsDataFrame") : rbind-like method, see notes be-
  low

Note

SpatialPolygonsDataFrame with default ID matching checks the data frame row names against
the Polygons ID slots. They must then agree with each other, and be unique (no Polygons objects
can share IDs); the data frame rows will be re-ordered if needed to match the Polygons IDs..
If you want to rbind objects with duplicated IDs, see spChFIDs.

```r
# simple example, from scratch:
Sr1 = Polygon(cbind(c(2,4,4,1,2),c(2,3,5,4,2)))
Sr2 = Polygon(cbind(c(5,4,2,5),c(2,3,2,2)))
Sr3 = Polygon(cbind(c(4,4,5,10,4),c(5,3,2,5,5)))
Sr4 = Polygon(cbind(c(5,6,6,5,5),c(4,4,3,3,4)), hole = TRUE)

Srs1 = Polygons(list(Sr1), "s1")
Srs2 = Polygons(list(Sr2), "s2")
Srs3 = Polygons(list(Sr3, Sr4), "s3/4")
SpP = SpatialPolygons(list(Srs1,Srs2,Srs3), 1:3)
plot(SpP, col = 1:3, pbg="white")
```

grd <- GridTopology(c(1,1), c(1,1), c(10,10))
polys <- as(grd, "SpatialPolygons")
centroids <- coordinates(polys)
x <- centroids[,1]
y <- centroids[,2]
z <- 1.4 + 0.1*x + 0.2*y + 0.002*x*y
ex_1.7 <- SpatialPolygonsDataFrame(polys,
data=data.frame(x=x, y=y, z=z, row.names=row.names(polys)))
brks <- quantile(z, seq(0,1,1/7))
cols <- grey((length(brks):2)/length(brks))
dens <- (2:length(brks))%o%3
plot(ex_1.7, col=cols[findInterval(z, brks, all.inside=TRUE)])
plot(ex_1.7, density=dens[findInterval(z, brks, all.inside=TRUE)])
```

Description

When the feature IDs need to be changed in SpatialLines* or SpatialPolygons* objects, these methods may be used. The new IDs should be a character vector of unique IDs of the correct length.
Methods

obj = "SpatialLines", x = "character"  replace IDs in a SpatialLines object
obj = "SpatialLinesDataFrame", x = "character"  replace IDs in a SpatialLinesDataFrame object
obj = "SpatialPolygons", x = "character"  replace IDs in a SpatialPolygons object
obj = "SpatialPolygonsDataFrame", x = "character"  replace IDs in a SpatialPolygonsDataFrame object

Note

It is usually sensible to keep a copy of the original feature IDs in the object, but this should be done by the user.

## End(Not run)
```

### spDistsN1

*Euclidean or Great Circle distance between points*

Description

The function returns a vector of distances between a matrix of 2D points, first column longitude, second column latitude, and a single 2D point, using Euclidean or Great Circle distance (WGS84 ellipsoid) methods.

Usage

```
spDistsN1(pts, pt, longlat = FALSE)
spDists(x, y = x, longlat = FALSE)
```
Arguments

pts A matrix of 2D points, first column x/longitude, second column y/latitude, or a SpatialPoints or SpatialPointsDataFrame object
pt A single 2D point, first value x/longitude, second value y/latitude, or a SpatialPoints or SpatialPointsDataFrame object with one point only
x A matrix of n-D points with row denoting points, first column x/longitude, second column y/latitude, or a Spatial object that has a coordinates method
y A matrix of n-D points with row denoting points, first column x/longitude, second column y/latitude, or a Spatial object that has a coordinates method
longlat if FALSE, Euclidean distance, if TRUE Great Circle distance

Value

spDistsN1 returns a numeric vector of distances in the metric of the points if longlat=FALSE, or in kilometers if longlat=TRUE.
spDists returns a full matrix of distances in the metric of the points if longlat=FALSE, or in kilometers if longlat=TRUE; it uses spDistsN1 in case points are two-dimensional. In case of spDists(x,x), it will compute all n x n distances, not the sufficient n x (n-1).

Note

The function can also be used to find a local kilometer equivalent to a plot scaled in decimal degrees in order to draw a scale bar.

spplot

Plot methods for spatial data with attributes

Description

Lattice (trellis) plot methods for spatial data with attributes

Usage

spplot(obj, ...)  
spplot.grid(obj, zcol = names(obj), ..., names.attr, scales = list(draw = FALSE),  
xlab = NULL, ylab = NULL, aspect = mapasp(obj,xlim,ylim),  
panel = panel.gridplot, sp.layout = NULL, formula, xlim = bbox(obj)[1, ],  
ylim = bbox(obj)[2, ], checkEmptyRC = TRUE, col.regions = get_col_regions())  
spplot.polygons(obj, zcol = names(obj), ..., names.attr, scales = list(draw = FALSE),  
xlab = NULL, ylab = NULL, aspect = mapasp(obj,xlim,ylim),  
panel = panel.polygonsplot, sp.layout = NULL, formula, xlim = bbox(obj)[1, ],  
ylim = bbox(obj)[2, ], col.regions = get_col_regions())  
spplot.points(obj, zcol = names(obj), ..., names.attr, scales = list(draw = FALSE),  
xlab = NULL, ylab = NULL, aspect = mapasp(obj,xlim,ylim),  
panel = panel.pointsplot, sp.layout = NULL, identify = FALSE, formula,  
xlim = bbexpand(bbox(obj)[1, ], 0.04), ylim = bbexpand(bbox(obj)[2, ], 0.04),  
edge.col = "transparent", colorkey = FALSE, col.regions = get_col_regions())  
mapLegendGrob(obj, widths = unit(1, "cm"), heights = unit(1, "cm"),  
fill = "black", just = "right")  
sp.theme(set = FALSE, regions = list(col = bpy.colors(100)), ...)  
layout.north.arrow(type = 1)  
layout.scale.bar(height = 0.05)  
spplot locator(n = 512, type = "n", ...)  
set_col_regions(value)  
get_col_regions()

Arguments

obj  
object of class extending Spatial-class
zcol  
character; attribute name(s) or column number(s) in attribute table
names.attr  
names to use in panel, if different from zcol names
scales  
scales argument to be passed to Lattice plots; use list(draw = TRUE) to draw axes scales; see xypplot for full options
...  
other arguments passed to levelplot (grids, polygons) or xypplot (points)
```
xlab  
label for x-axis
```
```  
ylab  
label for y-axis
```
aspect  aspect ratio for spatial axes; defaults to "iso" (one unit on the x-axis equals one unit on the y-axis) but may be set to more suitable values if the data are e.g. if coordinates are latitude/longitude

panel  depending on the class of obj, panel.polygonsplot (for polygons or lines), panel.gridplot (grids) or panel.pointsplot (points) is used; for further control custom panel functions can be supplied that call one of these panel functions, but do read below how the argument sp.layout may help

sp.layout  NULL or list; see notes below

identify  if not FALSE, identify plotted objects (currently only working for points plots). Labels for identification are the row.names of the attribute table row.names(as.data.frame(obj)). If TRUE, identify on panel (1,1); for identifying on panel i,j, pass the value c(i,j)

formula  optional; may be useful to plot a transformed value. Defaults to z~x+y for single and z~x+y|name for multiple attributes; use e.g. exp(x)~x+y|name to plot the exponent of the z-variable

xlim  numeric; x-axis limits

ylim  numeric; y-axis limits

edge.col  color of symbol edge

colorkey  logical; if TRUE, use continuous, levelplot-like colorkey instead of symbol key

widths  width of grob

heights  heights of grob

fill  fill color of grob

just  grob placement justification

set  logical; if TRUE, trellis.par.set is called, else a list is returned that can be passed to trellis.par.set()

regions  color ramp for the theme

height  height of scale bar; width is 1.0

n  see locator

type  see locator

checkEmptyRC  logical; if TRUE, a check is done to see if empty rows or columns are present, and need to be taken care of. Setting to FALSE may improve speed.

col.regions  vector with fill colours; in case the variable to be plotted is a factor, this vector should have length equal to the number of factor levels

value  vector with color values, default for col.regions

Value

spplot returns a lattice plot of class "trellis", if you fail to "see" it, explicitly call print(spplot(...)). If identify is TRUE, the plot is plotted and the return value is a vector with row names of the selected points.

spplot.locator returns a matrix with identified point locations; use trellis.focus first to focus on a given panel.

get_col_regions returns the default value for col.regions
Methods

- `obj = "SpatialPixelsDataFrame"` see `spplot`
- `obj = "SpatialGridDataFrame"` see `spplot`
- `obj = "SpatialPolygonsDataFrame"` see `spplot`
- `obj = "SpatialLinesDataFrame"` see `spplot`
- `obj = "SpatialPointsDataFrame"` see `spplot`

Note

Missing values in the attributes are (currently) not allowed.

`spplot.grid`, `spplot.polygons` and `spplot.points` are S4 methods for `spplot`; see `spplot-methods`.

Useful arguments that can be passed as ... are:

- `layout` integer; for the layout of panels (cols,rows)
- `pretty` logical; choose colour breaks at pretty numbers?
- `at` specify at which values colours change
- `as.table` logical; start drawing panels upper-left instead of lower-left
- `page` to add marks to each plotted page

For useful values see the appropriate documentation of `xyplot` (in case of points), and `levelplot` (otherwise).

If `obj` is of `SpatialPointsDataFrame`, the following options are useful to pass:

- `key.space` character: "bottom", "right", "left" or "right" to denote key location, or list: see argument key in the help for `xyplot` what the options are
- `legendEntries` character; array with key legend (text) entries; suitable defaults obtained from data
- `cuts` number of cuts, or, for objects of class `SpatialPointsDataFrame` only, the actual cuts to use
- `do.log` logical; if TRUE use log-linear scale to divide range in equal cuts, else use a linear scale if `cuts` is only number of cuts
- `pch` integer; plotting character to use; defaults to 16 if fill is `TRUE`, else 1
- `cex` numeric; character expansion, proportional to default value of 1
- `fill` logical; use filled circles?

`layout.north.arrow` and `layout.scale.bar` can be used to set a north arrow or scale bar.

The `sp.layout` argument is either a single layout item, or a list with one or more layout items. A layout item is a list with its first argument the name of the layout function to be called: `sp.points` for `SpatialPoints`, `sp.polygons` for `SpatialPolygons` object, `sp.lines` for a `SpatialLines` object, and `sp.text` for text to place. The second argument contains the object (or text) to be plotted; remaining arguments are passed to the corresponding `panel.*` functions.

The order of items in `sp.layout` matters; objects are drawn in the order they appear. Plot order and prevalence of `sp.layout` items: for points and lines, `sp.layout` items are drawn before the points (to allow for grids and polygons); for grids and polygons `sp.layout` is drawn afterwards (so the item will not be overdrawn by the grid and/or polygon). Transparency may further help when combining things.

Items of the `sp.layout` list, or its elements, can be:
which integer; controls to which panel a layout item should be added. If which is present in the main, top-level list it applies to all layout items; in sub-lists with layout items it denotes the (set of) panels in which the layout item should be drawn. Without a which item, layout items are drawn in each panel.

first logical; should the layout item be drawn before the main spplot object (TRUE), or after (FALSE)? This overrides the default order.

sp. theme returns a lattice theme; use, after loading package lattice, the command trellis.par.set(sp.theme()) after a device is opened or changed to make this work. Currently, this only sets the colors to bpy.colors.

If the attributes to be plotted are of type factor, spplot tries to create a legend that reflects this. In this case, the color ramp passed needs to be of the same length as the number of factor levels. The factor levels are derived from the first map; subsequent factors with different factor levels result in an error.

if (require(RColorBrewer)) {
spplot(meuse, c("ffreq"), sp.layout=list(l2,l3,l4,l5),
spsample  

table point locations in (or on) a spatial object

Description

sample point locations within a square area, a grid, a polygon, or on a spatial line, using regular or random sampling methods; the methods used assume that the geometry used is not spherical, so objects should be in planar coordinates

Usage

spsample(x, n, type, ...)  
makegrid(x, n = 10000, nsig = 2, cellsize, offset = rep(0.5, nrow(bb)))

Arguments

x  Spatial object; spsample(x,...) is a generic method for the existing sample.Xxx functions

...  optional arguments, passed to the appropriate sample.Xxx functions; see NOTES for nclusters and iter

n  (approximate) sample size

type  character; "random" for completely spatial random; "regular" for regular (systematically aligned) sampling; "stratified" for stratified random (one single random location in each "cell"); "nonaligned" for nonaligned systematic sampling (nx random y coordinates, ny random x coordinates); "hexagonal" for sampling on a hexagonal lattice; "clustered" for clustered sampling; "Fibonacci" for Fibonacci sampling on the sphere (see references).

bb  bounding box of the sampled domain; setting this to a smaller value leads to sub-region sampling

offset  for regular sampling only: the offset (position) of the regular grid; the default for spsample methods is a random location in the unit cell [0,1] x [0,1], leading to a different grid after each call; if this is set to c(0.5,0.5), the returned grid is not random (but, in Ripley’s wording, “centric systematic”). For line objects, a single offset value is taken, where the value varies within the [0,1] interval, and 0 is the beginning of each Line object, and 1 its end
cellsize if missing, a cell size is derived from the sample size \( n \); otherwise, this cell size is used for all sampling methods except "random"

nsig for "pretty" cell size; spsample does not result in pretty grids

Value

an object of class SpatialPoints-class. The number of points is only guaranteed to equal \( n \) when sampling is done in a square box, i.e. (sample.Spatial). Otherwise, the obtained number of points will have expected value \( n \).

When \( x \) is of a class deriving from Spatial-class for which no spsample-methods exists, sampling is done in the bounding box of the object, using spsample.Spatial. An overlay may be necessary to select afterwards.

Sampling type "nonaligned" is not implemented for line objects.

Some methods may return NULL if no points could be successfully placed.

makegrid makes a regular grid that covers \( x \); when cellsize is not given it derives one from the number of grid points requested (approximating the number of cells). It tries to choose pretty cell size and grid coordinates.

Methods

\[
\begin{align*}
x = "\text{Spatial}" & \quad \text{sample in the bbox of } x \\
x = "\text{Line}" & \quad \text{sample on a line} \\
x = "\text{Polygon}" & \quad \text{sample in a Polygon} \\
x = "\text{Polygons}" & \quad \text{sample in a Polygons object, consisting of possibly multiple Polygon objects (holes must be correctly defined, use checkPolygonsHoles if need be)} \\
x = "\text{SpatialPolygons}" & \quad \text{sample in an SpatialPolygons object; sampling takes place over all Polygons objects present, use subsetting to vary sampling intensity (density); holes must be correctly defined, use checkPolygonsHoles if need be} \\
x = "\text{SpatialGrid}" & \quad \text{sample in an SpatialGrid object} \\
x = "\text{SpatialPixels}" & \quad \text{sample in an SpatialPixels object}
\end{align*}
\]

Note

If an Polygon-class object has zero area (i.e. is a line), samples on this line element are returned. If the area is very close to zero, the algorithm taken here (generating points in a square area, selecting those inside the polygon) may be very resource intensive. When numbers of points per polygon are small and type="random", the number searched for is inflated to ensure hits, and the points returned sampled among these.

The following two arguments can be further specified:

clusters Number of clusters (strata) to sample from.

iter (default = 4) number of times to try to place sample points in a polygon before giving up and returning NULL - this may occur when trying to hit a small and awkwardly shaped polygon in a large bounding box with a small number of points

spTransform

spTransform for map projection and datum transformation

Description
spTransform for map projection and datum transformation

Usage
spTransform(x, CRSobj, ...)

Arguments
x object to be transformed
CRSobj object of class CRS
... further arguments

Value
object with coordinates transformed to the new coordinate reference system.

Note
Package sp only provides the definition of the generic, methods doing actual transformation are found in package rgdal, see spTransform

stack

rearrange data in SpatialPointsDataFrame or SpatialGridDataFrame for plotting with spplot (levelplot/xyplot wrapper)

Description
rearrange SpatialPointsDataFrame for plotting with spplot or levelplot

Usage
spmap.to.lev(data, zcol = 1:n, n = 2, names.attr)
## S3 method for class 'SpatialPointsDataFrame'
stack(x, select, ...)
## S3 method for class 'SpatialGridDataFrame'
stack(x, select, ...)
Arguments

data: object of class (or extending) SpatialPointsDataFrame or SpatialGridDataFrame
zcol: z-coordinate column name(s), or a column number (range) (after removing the spatial coordinate columns: 1 refers to the first non-coordinate column, etc.)
names.attr: names of the set of z-columns (these names will appear in the plot); if omitted, column names of zcol
n: number of columns to be stacked
x: same as data
select: same as zcol
... ignored

Value

spmap.to.lev returns a data frame with the following elements:

x: x-coordinate for each row
y: y-coordinate for each row
z: column vector with each of the elements in columns zcol of data stacked
name: factor; name of each of the stacked z columns

stack is an S3 method: it return a data.frame with a column values that has the stacked coordinates and attributes, and a column ind that indicates the variable stacked; it also replicates the coordinates.

See Also

spplot, levelplot in package lattice, and stack

Examples

library(lattice)
data(meuse.grid) # data frame
coordinates(meuse.grid) = c("x", "y") # promotes to SpatialPointsDataFrame
meuse.grid[["idist"]]= 1 - meuse.grid["dist"] # add variable
# the following is made much easier by spplot:
levelplot(z~x+y|name, spmap.to.lev(meuse.grid, z=c("dist","idist"), names.attr = c("distance", "inverse of distance")), aspect = "iso")
levelplot(values~x+y|ind, as.data.frame(stack(meuse.grid)), aspect = "iso")
gridded(meuse.grid) = TRUE
levelplot(z~x+y|name, spmap.to.lev(meuse.grid, z=c("dist","idist"), names.attr = c("distance", "inverse of distance")), aspect = "iso")
levelplot(values~x+y|ind, as.data.frame(stack(meuse.grid)), asp = "iso")
Compute surface area of a digital elevation model.

Description

It is often said that if Wales was flattened out it would have an area bigger than England. This function computes the surface area of a grid of heights taking into account the sloping nature of the surface.

Usage

```
surfaceArea(m, ...) surfaceArea.matrix(m, cellx = 1, celly = 1, byCell = FALSE)
```

Arguments

- `m` a matrix of height values, or an object of class `SpatialPixelsDataFrame` or `SpatialGridDataFrame`.
- `cellx` the size of the grid cells in the x-direction, in the same units as the height values.
- `celly` the size of the grid cells in the y-direction, in the same units as the height values.
- `byCell` return single value or matrix of values
- `...` ignored

Value

Either a single value of the total area if byCell=FALSE, or a matrix the same shape as m of individual cell surface areas if byCell=TRUE. In this case, the sum of the returned matrix should be the same value as that which is returned if byCell=FALSE.

Missing values (NA) in the input matrix are allowed. They will produce an NA in the output matrix for byCell=TRUE, and contribute zero to the total area. They also have an effect on adjacent cells - see code comments for details.

Methods

- `obj = "matrix"` takes a matrix as input, requires cellx and celly to be set
- `obj = "SpatialGridDataFrame"` takes an object of class `SpatialGridDataFrame` as input, and retrieves cellx and celly from this
- `obj = "SpatialPixelsDataFrame"` takes an object of class `SpatialPixelsDataFrame` as input, and retrieves cellx and celly from this

Author(s)

Barry Rowlingson <b.rowlingson@lancaster.ac.uk>, integration in sp Edzer Pebesma.
References

Examples

```
surfaceArea(volcano)
image(surfaceArea(volcano,byCell=TRUE))

data(meuse.grid)
gridded(meuse.grid) = ~x+y
image(surfaceArea(meuse.grid["dist"], byCell=TRUE))
surfaceArea(meuse.grid["dist"])
```

zerodist

```
find point pairs with equal spatial coordinates
```

Description

find point pairs with equal spatial coordinates

Usage

```
zerodist(obj, zero = 0.0, unique.ID = FALSE, memcmp = TRUE)
zerodist2(obj1, obj2, zero = 0.0, memcmp = TRUE)
remove.duplicates(obj, zero = 0.0, remove.second = TRUE, memcmp = TRUE)
```

Arguments

- `obj` object of, or extending, class `SpatialPoints`
- `obj1` object of, or extending, class `SpatialPoints`
- `obj2` object of, or extending, class `SpatialPoints`
- `zero` distance values less than or equal to this threshold value are considered to have zero distance (default 0.0); units are those of the coordinates for projected data or unknown projection, or km if coordinates are defined to be longitude/latitude
- `unique.ID` logical; if TRUE, return an ID (integer) for each point that is different only when two points do not share the same location
- `memcmp` use `memcmp` to find exactly equal coordinates; see NOTE
- `remove.second` logical; if TRUE, the second of each pair of duplicate points is removed, if FALSE remove the first
**Value**

`zerodist` and `zerodistR` return a two-column matrix with in each row pairs of row numbers with identical coordinates; a matrix with zero rows is returned if no such pairs are found. For `zerodist`, row number pairs refer to row pairs in `obj`. For `zerodistR`, row number pairs refer to rows in `obj` and `objR`, respectively. `remove.duplicates` removes duplicate observations if present, and else returns `obj`.

**Note**

When using kriging, duplicate observations sharing identical spatial locations result in singular covariance matrices. This function may help identify and remove spatial duplicates. The full matrix with all pair-wise distances is not stored; the double loop is done at the C level.

When `unique.ID=TRUE` is used, an integer index is returned. `sp` 1.0-14 returned the highest index, `sp` 1.0-15 and later return the lowest index.

When `zero` is 0.0 and `memcmp` is not `false`, `zerodist` uses `memcmp` to evaluate exact equality of coordinates; there may be cases where this results in a different evaluation compared to doing the double arithmetic of computing distances.

**Examples**

data(meuse)
summary(meuse)
# pick 10 rows
n <- 10
ran10 <- sample(nrow(meuse), size = n, replace = TRUE)
meusedup <- rbind(meuse, meuse[ran10, ])
coordinates(meusedup) <- c("x", "y")
zd <- zerodist(meusedup)
sum(abs(zd[1:n,1] - sort(ran10))) # 0!
# remove the duplicate rows:
meusedup2 <- meusedup[-zd[,2], ]
summary(meusedup2)
meusedup3 <- subset(meusedup, !{(1:nrow(meusedup) %in% zd[,2])})
summary(meusedup3)
coordinates(meuse) <- c("x", "y")
zerodist2(meuse, meuse[c(10:33,1,10),])
